play across facing pages by row

The image shows six 4x4 grid puzzles. Each grid contains numbers and empty cells. Some cells contain a number inside a circle. The puzzles are arranged in a row.

- Puzzle 1:** A 4x4 grid. Row 1: (1,1)=1, (1,2)=4, (1,3)=5, (1,4)=1. Row 2: (2,2)=7, (2,3)=3. Row 3: (3,1)=2, (3,2)=5, (3,3)=1, (3,4)=4, (3,5)=6, (3,6)=2. Row 4: (4,1)=3, (4,2)=6, (4,3)=2, (4,4)=5, (4,5)=7, (4,6)=3.
- Puzzle 2:** A 4x4 grid. Row 1: (1,1)=1. Row 2: (2,3)=3. Row 3: (3,4)=1. Row 4: (4,1)=6.
- Puzzle 3:** A 4x4 grid. Row 1: (1,1)=2, (1,3)=4, (1,4)=1. Row 2: (2,2)=6, (2,3)=1. Row 3: (3,4)=5.
- Puzzle 4:** A 4x4 grid. Row 1: (1,2)=7. Row 2: (2,1)=2, (2,2)=1. Row 3: (3,1)=3, (3,3)=5. Row 4: (4,4)=1.
- Puzzle 5:** A 4x4 grid. Row 1: (1,3)=1. Row 2: (2,1)=3, (2,3)=5. Row 3: (3,4)=1.
- Puzzle 6:** A 4x4 grid. Row 1: (1,4)=4. Row 2: (2,3)=1, (2,4)=6.

TRIAD SUBSETS OF HARMONIC MINOR

Major Sharp Five Scale-Tone Triad Arpeggios

harmonic minor is the mode on major #5 scale tone VI

These are numbered by major sharp five tones. Play on the fretboard by column in position or by row horizontally.

major #5	major sharp five	Dorian #4	Phrygian dominant	Lydian #2	Mixolydian #1	harmonic minor	Locrian nat. 6

MAJOR SCALE-TONE TRIAD INVERSIONS AND VOICE LEADING

See also the chapter on [Voice Leading/Major Scale-Tone Triad Voice Leading](#).

Triad Inversions

The root of a chord is the note it is named after. Bb is the root of Bb7#9 (B flat seven, sharp nine). The third is the note on the third step of the scale on which the chord is built. The the third may be flatted, as specified by the chord name. The fifth may be flatted or sharpened as specified by the chord name. See [Chord Naming Conventions/Triads](#) and [Chord Naming Rules by Chord Tone](#).

C major triad (1-3-5 of C major scale) C minor triad (1-b3-5 of C major scale) C diminished triad (1-b3-b5 of C major scale)

the letter names of each chord are listed in ascending order								
C major triad			C minor triad			C diminished triad		
root position	first inversion	second inversion	root position	first inversion	second inversion	root position	first inversion	second inversion
C	E	G	C	Eb	G	C	Eb	Gb
E	G	C	Eb	G	C	Eb	G	C
G	C	E	G	C	Eb	G	C	Eb

root position

In root position, the root of the chord is in the bass. The order of the third and fifth above the root (in pitch) are not specified by “root position”, only the root is specified in the bass.

first inversion

In first inversion, the third of the chord is in the bass. The order of the third and fifth above the third (in pitch) are not specified. “First inversion only specifies that the third is in the bass.

second inversion

In second inversion, the fifth of the chord is in the bass. The order of the root and third above the third (in pitch) are not specified. “Second inversion only specifies that the fifth is in the bass.

Using Triad Inversions to Create Scalar Basslines

The chord progressions in this section will serve as examples to think through the [Triad Voice Leading](#) section that follows. Often when the interval on two bass strings would be a third or sixth, the next to the lowest string is omitted to avoid muddiness in the bass. Perfect fourths and fifths are clearer in the bass.

root position, open position C major parent scale

Play this thirteen-chord progression in the order shown for ascending roots and in reverse order (I major, VII diminished, VI minor, etc) for descending roots.

bass roman	3 of parent III minor	4 of parent IV major	5 of parent V major	6 of parent VI minor	7 of parent VII^m7b5	1 of parent I major	2 of parent II minor
	Em I	F I	G I	Am I	Bm7b5 II	C I	Dm I
	1 5 1 b3 5 1	1 5 1 3 5 1	1 3 5 1 3 1	1 5 1 b3 5	1 b5 b7 b3	1 3 5 1 3	1 5 1 b3
	Em I	F I	G III	Am I	Bdim I	C III	
	1 b3 5 1	1 3 5 1	1 3 5 1	1 b3 5	1 b3 b5	1 3 5	

root position, C form F major parent scale

Play this thirteen-chord progression in the order shown for ascending roots and in reverse order (I major, VII^m7b5, VI minor, etc) for descending roots.

bass roman	3 of parent III minor	4 of parent IV major	5 of parent V major	6 of parent VI minor	7 of parent VII^m7b5	1 of parent I major	2 of parent II minor
	Am V	Bb VI	C V	Dm V	Em7b5 VII	F V	Gm V
	1 5 1 b3 5 1	1 5 1 3 5 1	1 3 5 1 3 1	1 5 1 b3 5	1 b5 b7 b3	1 3 5 1 3	1 5 1 b3
	Am V	Bb VI	C VIII	Dm V	Edim VI	F VIII	
	1 b3 5 1	1 3 5 1	1 3 5 1	1 b3 5	1 b3 b5	1 3 5	

first inversion, open position C major parent scale

Each of these chords has its third in the bass. VIIIm7b5 usually substitutes for VII diminished, which is rare in pop music. Play them in the order shown for ascending bass notes and in reverse order (I major, VIIIm7b5, VI minor, etc) for descending bass notes.

bass	3 of parent	4 of parent	5 of parent	6 of parent	7 of parent	1 of parent	2 of parent

	1 b3 5 b3	b3 5 1 5	1 5 3	3 5 1 5	1 b5 b7 b3	b3 5 1 b3	

root position & first inversion chords, root names in fourths, open position C major parent scale

In this progression, each chord is played in root position, then in first inversion to voice lead the bass note to the next root-position chord up a fourth from the first root position chord. Each minor chord is followed with a first inversion major version so its major third bass note precedes the bass note of the next chord by a half step (one fret). Play the progression only in the ascending order of bass notes as shown.

roman	VIIIm7b5	VIIIm7b5/b3	IIIIm	IIIImaj/3	VIIm	VIImaj/3	IIm
	Bm7b5 II	Bm7b5/D I	Em I	E/G# II	Am I	A/C# II	Dm I

root position & first inversion chords, root names in fourths, open position G major parent scale

In this progression, each chord is played in root position, then in first inversion to voice lead the bass note to the next root-position chord up a fourth from the first root position chord. Each minor chord is followed with a first inversion major version so its major third bass note precedes the bass note of the next chord by a half step (one fret). Play the progression only in the ascending order of bass notes as shown.

roman	VIIIm7b5	VIIIm7b5/b3	IIIm	IIImaj/3	VIIm	VIImaj/3	IIm

THE CHORD PROGRESSION GAME

Theory of Chord Construction and Progression

A chord root is the note after which a chord is named. The root of Cma9 is “C”. The root of Bb7b9 (“B” flat seventh, flat nine) is “Bb” (“B” flat). See [Chord-Naming Conventions](#).

Major scale-tone chord roots can progress in the order of fourths, stepwise, or thirds. See the [Major Scale-Tone Chord Cycles and Tables](#).

stepwise root order

Stepwise root order is ascends numerically 1-2-3-4-5-6-7-1-2, etc and descends 1-7-6-5-4-3-2-1-7-6, etc. Alphabetically, stepwise root order ascends A-B-C-D-E-F-G-A-B, etc. and descends A-G-F-E-D-C-B-A-G-F, etc. with certain letters sharped (#) or flatted (b) for most keys, as you can see on the [Major Scale-Tone Chord Cycles and Tables](#).

root order in fourths

Root movement in fourths is 7-3-6-2-5-1-4-7-3, etc. in numbers and B-E-A-D-G-C-F-B-E-A, etc. in letters. In reverse order, this is fifths” 4-1-5-2-6-7-3-7 (repeating cycle) in numbers and F-C-G-D-A-E-B (cycle) in letters.

B# E# A# D# G# C# F# B E A D G C F Bb Eb Ab Db Gb Cb Fb

In the complete series of perfect fourths (above), any seven in a row are a major scale, with “1” next-to-last, which names the major scale. It is also the accumulative order of flats in flat key signatures.

Chords with root movement in fourths (B-E-A-D-G-C-F) in C major are B dim., Em (IIIIm), Am (VIIm), Dm (IIIm), G (V), C (I), F (IV), B dim., Em (IIIIm), Am, etc. This order can also be used in reverse, which is down in fourths or up in fifths:

Fb-Cb-Gb-Db-Ab-Eb-Bb-F-C-G-D-A-E-B-F#-C#-G#-D#-A#-E#-B#

root order in thirds

Root movement up in thirds is 1-3-5-7-2-4-6 (repeating cycle). in numbers and F-A-C-E-G-B-D (cycle) in letters. Roots down in thirds are 6-4-2-7-5-3-1 or -D-B-G-E-C-A-F,

Chords with root movement in stepwise order in C major are C (I), Dm (IIIm), Em (IIIIm), F (IV), G (V), Am (VIIm), B dim. or m7b5 (VII dim or VIIIm7b5), C, Dm, Em, etc. This order can also be used in reverse: C-B dim.-Am-G, etc., which is still stepwise.

Chords with root movement up in thirds in C major are C (I), Em (III^m), G (V), B dim. or Bm7b5 (VII dim or VII^m7b5), Dm (II^m), F (IV), Am (VI^m), C, G, B dim, etc. This order can also be used in reverse: F-C-G-D, etc., which is then root movement in fifths.

making phrases with chord progression

Chords are usually phrases in groups of four, eight, twelve, sixteen, twenty four or thirty two bars, but don't have to be. To give the familiar sound of order to a chord progression, it helps to have sequences of two or more chords with their roots progressing in stepwise or fourths order. Roots moving in thirds are used less often.

The Rules of the Game

start experimenting with four, eight, twelve-bars progressions

The most common chord progressions used for song sections (verse, chorus, bridge, section A, section B, etc.) are four, eight, twelve, sixteen or thirty two bars in length. Start your experimenting in creating shorter chord progressions of four, eight or twelve bars.

beats per bar

4/4, the most common time signature is best to start with. 4/4 has four beats per bar and each beat is equivalent to a quarter note in music notation.

first and last chords of the progression

Good first and last chords of chord progressions are those chords that can establish a key or temporary key: I, II^m, IV, V and VI^m (C, Dm, F, G and Am in the key of C).

the duration of each chord

To give you and the listener time to contemplate each chord yet still have an ongoing sense of chord change, one chord per bar or two chords per bar are good to start with. You may occasionally want to use a chord for two bars to complete a four or eight bar progression.

chord qualities

Keep it simple. Start with major scale-tone triads. Major, minor and diminished chords makeup the triads built on each major scale. Read their letter names and qualities on any row of the stepwise table on the left side of the [Major Scale-Tone Chord Cycles and Tables](#). The letter in the "1" column (numbered "1" at the top of the first column) designates the name of the major scale. Letter names such as C, Bb (B flat) or F# (F sharp) with nothing after the letter name are major. Those followed by "m" such as the "m" ending the chord name "Am" are minor (A minor). The row with "C" in the "1" column lists the chords on the seven steps of the "C" major scale: C-Dm-Em-F-G-Am-Bdiminished.

substituting V/3 for VII diminished

Notice the alternatives in the “VII” column of the tables in [Major Scale-Tone Chord Cycles and Tables](#).

Since the VII diminished chord (B. diminished in the key of C) is rarely used, substitute the V chord (G) with the seventh tone of the major scale in the bass. In C, this is G/B (G with a “B” bass), numerically V/3, since it is the V chord of C and the bass note is “3” in the key of the chord, G. In G, substitute D/F# for VII diminished, which would be V/3 of G. Here are some fingerings for those chords:

chords with their third in the bass (the third in the key of the chord root)

G/B I 	G/B V 	C/E I 	C/E V 	F/A I 	F/A III 	F/A V 	F/A X
D/F# I 	D/F# VII 	A/C# II 	A/C# VII 	E/G# II 	E/G# IV 	B/D# IV 	F#/A# IV
C#/E# VI 	G#/B# VI 	Bb/D III 	Eb/G VIII 	Ab/C VI 	Db/F VI 	Gb/Bb IV 	Cb/Eb IV

substituting III major for III minor

Notice the alternatives in the “III” column of the tables in [Major Scale-Tone Chord Cycles and Tables](#).

III major (E) has been used historically in place of III minor (Em) to precede VIIm (Am), making the chord progression stronger. Three major has been used more freely recently, especially in the last fifty years in pop music. III major (E) may sound as if it will progress to VIIm (Am), because that’s what we’ve heard in classical music, ragtime and traditional jazz. It may then unexpectedly progress to IV (F), where IV has two of the same notes as VIIm and ambiguously sounds somewhat resolved. VIIm (Am) has scale tones 6-1-3 of the major scale on which it was built (C major), while IV major has scale tone 4-6-1 of the major scale on which it was built (C major). They share tones “1” and “6”, so they sound similar and can be involved in chord progressions somewhat interchangeably.

fourths, stepwise and third order of chord roots

Use more fourths order, some stepwise order and order of thirds least. Once you get a sense of how the Chord Progression Game works, “reverse construct” some known songs that use chords all from one major scale. You can identify them as being from one major scale by confirming all their names are in a single row of [Major Scale-Tone Chord Cycles and Tables](#).

Any of these order of roots (fourths, stepwise or thirds) can be used in forward or reverse order. Choose three or more chords in one of the systems of order, such as fourths (Dm-G-C in the C major scale). Find the last chord from your first sequence (C) in the another system of order (stepwise) and progress two or more chords farther in that order (C-G/B-Am-G). Experiment with the duration of each chord and find something that makes a likeable four-bar or eight-bar phrase.

step-by-step procedure

- ✦ Choose a single major scale, in a horizontal row on the Major Scale-Tone Chords chart below.
- ✦ Decide on a few chords in fourths, fourths or thirds root movement.
- ✦ Keep the last chord from step 2 in mind, which could be called the “pivotal” chord. Find it in another order of root movement (in stepwise, thirds or fourths) and continue in the new order.
- ✦ Continue the progression as long as you like, finding the last chord you used in one order in another and continuing from there.

sample progression

Start with the ascending fourths sequence Dm-G-C (IIIm-V-I of C). Then, from the “C” chord, progress stepwise C-G/B (substitute for VII)-Am then up a third to C (I) and down a fourth to G (V). Then repeat, but replace the fourth chord with “E” (substituting E for Em), progressing a third from C to E and a fourth from E to Am. End on Am.

bar 1 Dm I G I 	bar 2 C I G/B I 	bar 3 Am I C I 	bar 4 G I
bar 5 Dm I G I 	bar 6 C I G/B I 	bar 7 Am I C I 	bar 8 G I

end on Am
 Am I

Major Scale-Tone Chord Cycles and Tables

In the tables below, each row is a key. Read a row for a key all the way across the three tables.

stepwise

With stepwise roots, ascending suggests going somewhere. Descending suggests returning. All notes change (1-3-5 to 2-4-6).

thirds

Progression in thirds is incidental. Each chord to the next only changes one note (1-3-5 to 3-5-7).

fourths

Progression in fourths is pivotal. With triads, one note is retained and two note move up a scale tone (1-3-5 to 1-4-6).

USING TRIADS IN IMPROV AND COMPING

Preparation

In improvising melody and comping (composing an accompaniment part spontaneously), you need to quickly perform the three-step procedure below:

1. determine the scale-tone chord type by number.
2. choose arpeggio, chord, and/or pentatonic fingering(s).
3. determine seven tone scale fingering.

Determining a Scale-Tone Chord by Number

In a chord progression, groups of consecutive chords usually occur in the same heptatonic (seven-tone) scale, and more commonly in the major scale. A good first step in recognizing the numbered scale tones on which a group of chord roots have occurred is to identify a scale-tone pair of chords.

Unique And Ambiguous Major Scale-Tone Pairs Of Chords

If you see two major chords with their roots a whole step (two frets) apart, you should suspect they have come from major scale tones four and five and are “IV type” and “V type” chords. Two minor roots a whole step apart should be suspected as “II type” and “III type”. A minor chord root progressing up a half step (one fret) to a major chord is probably “III type” to “IV type”.

Any major scale-tone triad pair of chords that includes a diminished triad (on the seventh step of the major scale), is unique. With roots moving in perfect fourths, the only other unique pair of triads is IIm to V. In stepwise order, every pair in the cycle from IIm to V is unique (IIm to IIIm, IIIm to IV and IV to V). With roots moving in thirds the only unique pairs of triads include the VII diminished triad.

Three Categories of Arpeggio and Heptatonic Scale Fingerings

Arpeggios and heptatonic (seven-tone) scales usually fall into these categories for the location of the low octave root or tone center:

index finger

middle finger, in this case meaning the middle or ring finger

little finger, in this case meaning the ring or little finger

Notice that the ring finger could be in either category as a middle finger or little finger. Where it is the high-pitched note used on a string, it can be in the “little finger” category. Where the ring finger is next to highest-pitched note on a string, it is in the middle finger category.

PRINCIPLES OF ACCEPTABLE DISSONANCE

Questions of Actual Dissonance and Mood

We decide whether a chord is acceptable or not according to the beating that physically occurs when notes are close together in pitch *and* by mood and style.

major seventh and minor seventh chords are romantic by combining happy and sad

Major chords sound happy and minor chords sound sad. Like a romantic literary work or film, major seventh chords are romantic because the triad on their root is major (1-3-5) and the triad on their third is minor (3-5-7). Since the major triad occurs on the root, the major seventh has a happy basis and a minor undertone.

Minor seventh chords such as IIm7 with parent scale tones 2-4-6 and 1 are romantic also, but have a sad (minor, such as 2-4-6) basis with a happy undertone (major, such as 4-6-1). The IIm7 is constructed with tones 2-4-6-1 of its parent scale and the 2-4-6 part makes a II minor triad while the 4-6-1 part makes a IV major triad. See [Number And Letter Cycles](#) and [Basic Chord Construction](#).

dominant seventh chords combine happy and depressed

Dominant seventh chords such as V7, with parent scale tones 5-7-2-4 are angry or funky in mood, since they combine drastically opposed moods: happy and oppressed. The triad on the root of a V7 chord is the happy major chord (5-7-2 of the parent), while the triad on the third of a V7 chord is oppressed (or depressed), being the diminished triad made with tones 7-2-4 of the parent scale.

Specific Attributes

notes a half step apart are usually voiced in different octaves

Half steps in the same octave are very dissonant, but sometimes this is desirable, such as voicing the ninth and the flatted third of a minor ninth chord in the same octave.

critical dissonance, usually unacceptable

The third and fourth, even if in different octaves. The b6 and the 5, unless in different octaves on a dominant chord (with a natural 3 and b7).

controversial dissonance when voiced in the same octave

1 and b2 (=b9), 2 and b3, #9 (= #2) and 3, #4 (= #11) and 5, 5 and b13(=b6), #5 and 13(=6), 6 and b7, 7 and 1.

acceptable dissonance when voiced in different octaves

1 and b2 (=b9), 2 and b3, #9 (= #2) and 3, #4 (= #11) and 5, 5 and b13 (=b6), #5 and 13 (=6), 6 and b7, 7 and 1.

b9, #9 (“proxy”), and b13 (“proxy”) chord tones are only used on dominant chords

The hypothetical IIIIm9 and VIIImb5b9 ninth chords on steps III and VII are not acceptable, since they would have flat ninths. We only find flat ninths acceptable on dominant chords (chords with a major third and flattened seventh). Similarly, we only accept sharp nine and sharp five on dominant chords.

The name minor #5 is sometimes used, but is really a way to name a major triad on the note that is “#5”.

#9 is used to allow a flat three in a chord with a natural three, since #9 = b3. So, #9 could be called a “proxy” for b3.

b13 is used to allow a sharp five in a chord with a natural five, since b13 = b6 = #5. So, b13 could be called a “proxy” for #5.

b5, #5 “proxy” chord tones

#4 can be used as a proxy for b5. b6 can be used as a proxy for #5.

ALL MAJOR SCALE-TONE CHORDS

Major Scale-Tone (MST) modes in terms of the seventh chord and remaining 2, 4, 6

Memorize the major scale-tone seventh chord qualities built on each scale tone first. Then memorize the remaining 2, 4 and 6 to be able to build all scale tone chord types, as you will learn in this chapter. The only mode that has #4 is Lydian. So, for most MST modes, the question is “what’s the 2 and 6”. modes III and VII are the only modes with b2. The major modes I, IV and V have a natural 6. Dorian also has natural 6 (the brightest mood of the minor modes). The other three modes have b6: VI Aeolian, III phrygian and VII Locrian.

Constructing Major Scale-Tone Chords

the primary structure of chords is thirds

In the standard method of construction, major scale-tone chords are built with every-other note, using the cycle of thirds shown below. Each triad uses three consecutive notes from the cycle. The I major triad uses scale tones 1-3-5. The II minor triad uses scale tones 2-4-6, and so on. Each quadrad (specifically a tertian scale tone quadrad, commonly called a scale-tone seventh chord) uses four consecutive notes from the cycle. The I major seventh chord uses scale tones 1-3-5-7. The II minor seventh chord uses scale tones 2-4-6-1 and so on.

numbered major scale tones used in scale tone triads, seventh and ninth chords

scale-tone:	I	II	III	IV	V	VI	VII
triad.....	I major	II minor	III minor	IV major	V major	VI minor	VII dimin.
parent scale tones	1-3-5	2-4-6	3-5-7	4-6-1	5-7-2	6-1-3	7-2-4
chord scale tones	1-3-5	1-b3-5	1-b3-5	1-3-5	1-3-5	1-b3-5	1-b3-b5
seventh chord	I _{ma} 7	II _m 7	III _m 7	IV _{ma} 7	V7	VI _m 7	VII _m 7b5
parent scale tones....	1-3-5-7	2-4-6-1	3-5-7-2	4-6-1-3	5-7-2-4	6-1-3-5	7-2-4-6
chord scale tones	1-3-5-7	1-b3-5-b7	1-b3-5-b7	1-3-5-7	1-3-5-b7	1-b3-5-b7	1-b3-b5-b7
ninth chord	I _{ma} 9	II _m 9	no chord	IV _{ma} 9	V9	VI _m 9	no chord
parent scale tones....	1-3-5-7-2	2-4-6-1-3		4-6-1-3-5	5-7-2-4-6	6-1-3-5-7	
chord scale tones	1-3-5-7-2	1-b3-5-b7-2		1-3-5-7-2	1-3-5-b7-2	1-b3-5-b7-2	

I^{ma}7 is 1-3-5-7 of the parent scale

The largest chord built on major scale tone one in thirds is I^{ma}9. The 11 (= 4) is dissonant against the 3 and the “3” is forms the primary character of the chord, so the 11 (4) is not used except in I sus. 4 chords.

II^m7 is 2-4-6-1 of the parent major scale

The largest acceptable chord built in thirds on major scale tone two is II^m13. A wide variety of chords is available.

III^m7 is 3-5-7-2 of the parent major scale

The largest acceptable chord built in thirds on major scale tone three is III^m7. Phrygian mode (major scale mode III) has b2 and b6. b9 (= b2) is only usable on dominant chords, so you can only use the b2 if the chord is change to III7 (as opposed to III^m7) making a III7b9. When the III7 chord is used, the b6 is available to make III7#5.

IV^{ma}7 is 4-6-1-3 of the parent major scale

The largest chord built in thirds on major scale tone four is the IV^{ma}13#11. Lydian mode (major scale mode IV) has #4. The #4 can be used as a proxy for b5 in IV^{ma}7b5, IV^{ma}9b5 or IV^{ma}9/6b5.

V7 is 5-7-2-4 of the parent major scale

The largest acceptable chord built in thirds on major scale tone five is the V9. V13 is usually voiced without 11 (=4) is dissonant against the 3). So, without the 11, V13 is really V9/6 or V13 no 11. If the 11th is used, the third is usually omitted, which makes V13sus4. V11 is usually voiced without the third, and therefore could be called V9sus4.

VI^m7 is 6-1-3-5 of the parent major scale

The largest acceptable chord built in thirds on major scale tone six is VI^m11. Aeolian mode (major scale mode VI) has b6, which equals b13. The flatted sixth cannot be used, since b6 (= b13) is only usable on dominant chords where it is a “proxy” for #5.

VII^m7b5 is 7-2-4-6 of the parent major scale

The largest acceptable chord built in thirds on major scale tone seven is VII^m7b5. Locrian mode (major scale mode VII) has b2, which equals b9. The flatted ninth cannot be used, since b9 is only usable on dominant chords.

Major Scale-Tone Chords by Type

The types are shown in the far left column.

scale-tone:	I	II	III	IV	V	VI	VII

harmonic minor scale-tone modes in terms of seventh chords and remaining 2, 4, 6.

Once you memorize the seventh chords and “remaining 2, 4, 6” for the major scale, you can put each mode through a conversion process to convert it to a harmonic minor scale-tone mode.

<u>har.m.</u>	<u>maj. #5</u>	<u>altered tones</u>	<u>7th & 246</u>	<u>description</u>
I	VI	b3 b6	m(ma7) (24b6)	Aeolian natural 7 (major mode VI with n7)
II	VII	b2 b3 b5 b7	m7b5 (b246)	major #5 (major mode I with #5)
bIII	I	#5	ma7#5 (246)	
IV	II	b3 #4 b7	m7 (2#46)	Dorian #4 (major mode II with #4)
V	III	b2 b6 b7	7(b24b6)	Phrygian major (major mode III with n3)
bVI	IV	#2 #4	ma7(2#46)	Lydian #2 (major mode IV with #2)
VII	#V	b2 b3 b4 b5 b6 bb7	dim.7(b2b4b6)	Mixolydian #1 (major mode V with #1)

Im(ma7) (also available: 2, 4, b6)

The largest chord built in thirds is Im9(ma7). b6 is not used in this chord, since too dissonant with “5”.

IIIm7 b5 (also available: b2, 4, 6)

The largest usable chord built in thirds on scale tone two of harmonic minor is IIIm7b5. “b2” is not used in this chord, since too dissonant with “1”. “b6” is also not used in this chord, since too dissonant with “5”. IIIm7/11b5 is usable if “4” and “b5” are not voiced in the same octave.

bIIIma7#5 (also available: 2, 4, 6)

The largest chord built in thirds is bIIIma9#5. “4” is not used in this chord, since too dissonant with “3”. “6” is not used in this chord, since too dissonant with “#5”.

IVm7 (also available: 2, #4, 6)

The largest chord built in thirds is IVm9. “#4” is not used with “n5” in this chord, but “#5” can be used as a “proxy” tone to represent “b5”. “6” can be combined with m7 to make m7/6 or with m9 to make m9/6.

V7 (also available: b2, 4, b6)

The largest chord built in thirds is V7b9. “4” is not used with “3” in this chord, but “4” can be used in a V7sus.4 chord. “b6” can be used to replace “5” as a “proxy” for #5, or “b6” can be used as a “proxy” for #5 so a chord can have “n5” and “#5” both, in effect.

bVIma7 (also available: #2, #4, 6)

The largest chord built in thirds is bVIma7. “6” can be used to make a sixth chord, or added to the IVma7 to make IVma7/6. “#2” is not used with “3” in this chord. “#4” can be used to replace “5” as a “proxy” for b5, or “#4” can be used as a “#11” in a IVma7#11 or IVma7/6/#11 chord.

VIIIdim7 (also available: b2, b4, b6)

The largest chord built in thirds is VIIIdim7.

TRIAD EMOTIVE QUALITIES

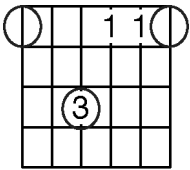

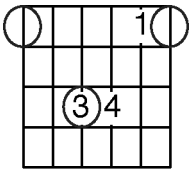

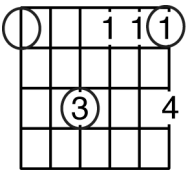

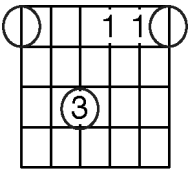

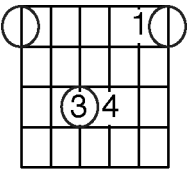

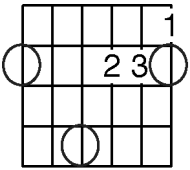

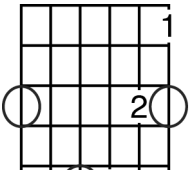

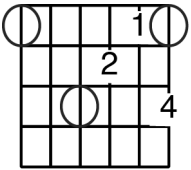

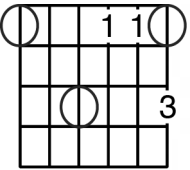

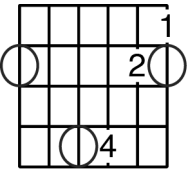

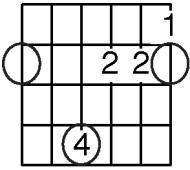

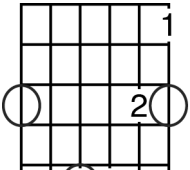

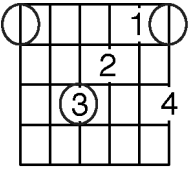

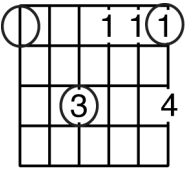

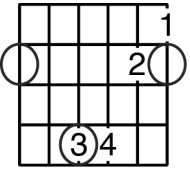

Singular Triad Moods

Triads can be identified aurally by their emotive quality. Major chords sound happy, minor sad. Other factors can influence the mood and effect the emotive quality of a triad. A fast swing rhythm, for example, makes a song feel cheerful, even when used on a minor chord. A long, slow song featuring major chords, can sound a bit more somber than a fast song.

quality	major	minor	diminished	augmented	suspended fourth	suspended second
mood	happy	sad	depressed	tormented	heavenly	positive, other- worldly, modern
						

Paired Triad Moods in Seventh Chords

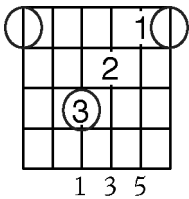

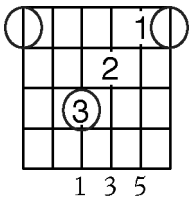

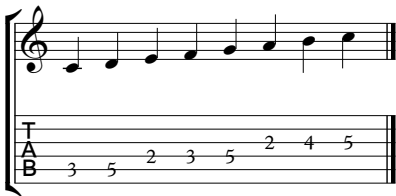

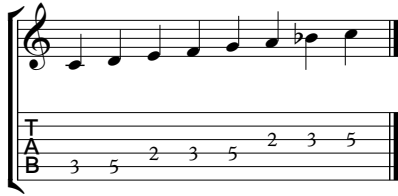

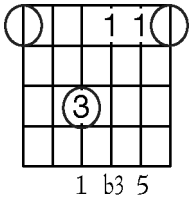

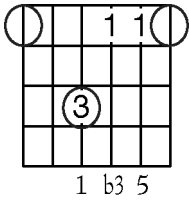

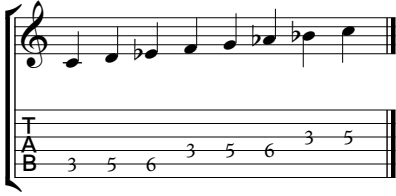

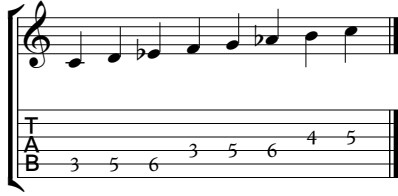

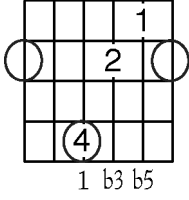

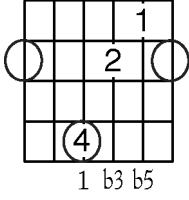

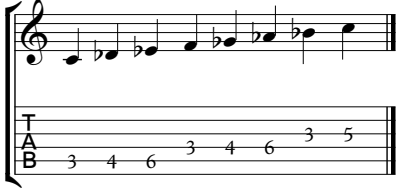

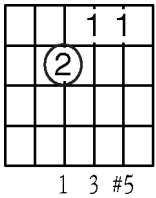

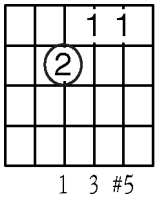

quality	major 7	7 (dominant 7)	minor 7	m7b5	dim. 7 (°7)
combined triads	major + minor	major + diminished	minor + major	diminished + minor	dim. triad serial (repeating) pattern
mood	Romantic, leaning toward happy. A bright, open sound with two perfect fifths. Exotic dissonance when voicing 7 next to 1.	Aggressive, funky.	Romantic, leaning toward sad. Dark, open sounds with two perfect fifths.	Sad, but beautiful, synonym of minor sixth with the sixth as a bright color	Dark, open sound with two perfect fifths.
triad on root					
triad or cluster on third					
quadrad					
exotic voicing					

quality	m(ma7) (minor, major 7)	7 sus 4	major add 9	minor add 9	ma7sus4
combined triads	minor + augmented	suspended fourth + 1-2-4 cluster	major + 1-3-7 cluster	minor + 1-3-7 cluster	suspended + 1-2-b5 cluster
mood	Dark dilemma.	Aggressive, funky.	Bright, open sounds with three notes in stacked fifths.	Dark, exotic, Asian, with three notes in stacked fourths. Exotic dissonance when voicing 7 next to 1.	Heavenly and provocative.

exotic voicing					

CHORD QUALITIES EXPRESSED BY SCALES

A melody made with an scale will primarily express the same emotive quality as the triad on which it is based. Other attributes to a piece of music can slant the emotive quality one way or another. Although a minor scale is sad, a lively rhythm, like an up-tempo swing can brighten the mood. A major key melody like Let It Be may be saddened by the slow “funeral march” tempo and the ambiguous temporary tone center moving from C major to A minor.

The table below shows common scales and the emotive qualities based on their tonic triads. A tonic triad is built with the first, third and fifth steps of the scale (technically a tonic tertian triad).

tonic triad	quality	scale examples	
major 	happy	major scale (Ionian mode)	Mixolydian mode (scale)
			
minor 	sad	Aeolian mode (scale)	harmonic minor scale
			
diminished 	depressed	Locrian mode (scale)	Aeolian flat five scale
			
augmented 	tormented	whole tone scale	super Locrian scale (b6 proxies as #5)
			

SUMMARIZING EMOTIVE QUALITIES IN CHORD PROGRESSION

Chord progression can be conceptually abbreviated. In improving over a four-chord progression like Am-G-F-G, one could improvise as if it were all an A minor chord. This would be treating the “G” chords as passing chords and treating the F as an Fma7, which includes the notes of Am. This same conception happens in every thing we listen to, without the listener necessarily realizing it.

In the [Substitution](#) chapter, in the sections [Abbreviate, Elaborate or Alter Chord Progression](#) and [Abbreviating Chord Pairs](#), you can learn how to abbreviate chord progression. Abbreviate a chord progression to a single chord and think of the emotive quality of that chord.

CHORD SYNONYMS

Synonyms are alternate names for chords that share the same notes. Am7 has the notes A-C-E-G. So does C6 (C-E-G-A). By thinking of the synonym for a chord, you can change the emotive quality. Pat Martino, for example, uses a “minor conversion” theory and thinks of all the minor synonyms for chords in a progression. Likewise, you could think of all the major synonyms. Study Improv By Ear/[Deciding How You Will Depict the Chords](#), Chord-Naming Conventions/[Chord Synonyms](#).

Recognizing Scale-Tone Chords

- **Number Cycles**
- **Devices Used to Recognize Scale-Tone Chords**
- **Unique and Repeating Series of Scale Tone Chords**
- **Major Scale-Tone Chords**
- **Modal Major Scale-Tone Chords**
- **Major Sharp Five Scale-Tone Chords**
- **Melodic Minor Scale-Tone Chords**
- **Major Flat Six (harmonic major) Scale-Tone Chords**
- **Adding the 2, 4 and 6 to Seventh Chords**
- **Major and Minor II-V Cadences**
- **Scales for Altered Dominant Chords**
- **Scales for Diminished Chords**

NUMBER CYCLES

Memorize the three cycles in which chord roots can move: stepwise, thirds and fourths. Study all possible pairs of scale-tone triads, looking for unique pairs and duplicate pairs.

DEVICES USED TO RECOGNIZE SCALE-TONE CHORDS

Memorize Key Signatures

If you have key signatures memorized, you can recognize the parent scale used in a song, then contemplate the chords built with that parent scale (see [Key Scales, Parent Scales & Chord Scales](#)) and the pentatonic scale subsets (see [Scale-Tone Arpeggios and Pentatonics/Major Scale-Tone Pentatonic Scales](#)).

Memorizing Scale-Tone Chords

By memorizing the chords constructed on common scales, you can recognize them when they occur in songs. It's especially useful to also memorize the sequence of chord roots in fourths, which is the most common order of chord roots in songs. See the following:

[Unique and Repeating Series of Scale-Tone Chords.](#)

[Scale-Tone Arpeggios and Pentatonics/Major Scale-Tone Tertian Triad Arpeggios,](#)

[Scale-Tone Arpeggios and Pentatonics/Major Scale-Tone Tertian Seventh Arpeggios,](#)

[Scale-Tone Arpeggios and Pentatonics/Major Scale-Tone Tertian Ninth Arpeggios,](#)

[Scale-Tone Arpeggios and Pentatonics/Major Scale-Tone Full-Tertian Arpeggios,](#)

[Major Scale-Tone Triads, Scale-Tone Seventh Chord Progression.](#)

Memorizing II-V-I Cadences

The most common three chord cadence in jazz is II-V-I. It occurs on major or minor. See the section [Major and Minor II-V-I Cadences](#) and the chapter [Modal II-V-I Cadences and Turnarounds](#).

UNIQUE AND REPEATING SERIES OF SCALE-TONE CHORDS

This is the most common method of identifying sets of chords derived from scales. These are all conceived in regard to chord root movement and quality. For reference, see Major (Ionian) Scale Tone Chord, Major Sharp Five Scale-Tone Chords, Melodic Minor Scale Tone Chords

Unique Triad and Seventh Chord Progression

stepwise

Major scale tone III^m to IV^{ma} and VII diminished to I^{ma}.

Major scale tone III^m7 to IV^{ma}7, IV^{ma}7 to V7 and VII^m7^b5 to I^{ma}7.

fourths

Major scale tone VII diminished to III^m, II^m to V^{ma} and IV^{ma} to VII dim.

Major scale tone VII^m7^b5 to III^m7, II^m7 to V7 and IV^{ma}7 to VII^m7^b5.

thirds

Major scale tone I^{ma} to III^m, V^{ma} to VII dim and VII dim to II^m.

Repeating Series Triad and Seventh Chord Progression

stepwise

Major scale tone II^m to III^m and IV^{ma} to V^{ma}.

Major scale tone II^m7 to III^m7.

fourths

Major scale tone III^m to V^{Im}, V^{Im} to II^m, III^m to V^{Im} to II^m, V^{ma} to I^{ma}, I^{ma} to IV^{ma}, V^{ma} to I^{ma} to IV^{ma}.

Major scale tone III^m7 to V^{Im}7, V^{Im}7 to II^m7, III^m7 to V^{Im}7 to II^m7, I^{ma}7 to IV^{ma}7.

thirds

Major scale: none.

MAJOR (IONIAN) SCALE-TONE CHORDS

Where there is no entry, the chord that would have occurred is not currently acceptable.

chords with roots in stepwise order

scale tone	I	II	III	IV	V	VI	VII
triad (3-note)	major	minor	minor	major	major	minor	diminished
key tones	1-3-5	2-4-6	3-5-7	4-6-1	5-7-2	6-1-3	7-2-4
seventh (4-note)	ma7	m7	m7	ma7	7	m7	m7b5
key tones	1-3-5-7	2-4-6-1	3-5-7-2	4-6-1-3	5-7-2-4	6-1-3-5	7-2-4-6
ninth (5-note)	ma9	m9		ma9	9	m9	
key tones	1-3-5-7-2	2-4-6-1-3		4-6-1-3-5	5-7-2-4-6	6-1-3-5-7	
available others	2-(4)-6	2-4-6	b2-4-b6	2-#4-6	2-(4)-6	2-4-b6	b2-4-b6

chords with roots in perfect fourth order

scale tone	VII	III	VI	II	V	I	IV
triad (3-note)	dim.	minor	minor	minor	major	major	major
seventh (4-note)	m7b5	m7	m7	m7	7	ma7	ma7
ninth (5-note)			m9	m9	9	ma9	ma9

chords with roots in order of thirds

scale tone	I	III	V	VII	II	IV	VI
triad (3-note)	major	minor	major	dim.	minor	major	minor
seventh (4-note)	ma7	m7	7	m7b5	m7	ma7	m7
ninth (5-note)	ma9		9		m9	ma9	m9

Memorize the qualities of major scale-tone triads, seventh chords, and ultimately all major scale-tone chords used in practice. Learn to interpret each chord in terms of both its formula numbering (based on a major scale on its root) and key-scale-tone numbering (in terms of the numbered tones of a major scale named after the key in which the chord occurs).

MODAL MAJOR SCALE-TONE CHORDS

Major mode	I	II	III	IV	V	VI	VII
triad	major	minor	minor	major	major	minor	dimin.
seventh	ma7	m7	m7	ma7	7	m7	m7b5
7th parent tones	1-3-5-7	2-4-6-1	3-5-7-2	4-6-1-3	5-7-2-4	6-1-3-5	7-2-4-6
7th chord scale tones	1-3-5-7	1-b3-5-b7	1-b3-5-b7	1-3-5-7	1-3-5-b7	1-b3-5-b7	1-b3-b5-b7

Mixolydian S.T.	IV	V	VI	bVII	I	II	III
Dorian S.T.	bVII	I	II	bIII	IV	V	VI
Aeolian S.T.	bIII	IV	V	bVI	bVII	I	II
Phrygian S.T.	bVI	bVII	I	bII	bIII	IV	V
Locrian S.T.	bII	bIII	IV	bV	bVI	bVII	I

modal scale-tone thirds

On the following pages, notice that the scale-tone thirds (s.t. thirds) are always the same series of numbers. They start with a scale-tone number, proceed through the cycle of thirds with the appropriate altered numbers for the mode. For example, the second step of major (major is also called Ionian mode) has the scale-tone thirds “2-4-6-1-3-5-7”. The second step of Dorian has the scale-tone thirds “2-4-6-1-b3-5-b7”. The second step of Phrygian (b2) has the scale-tone thirds “b2-4-b6-1-b3-5-b7”. Without the flats, they each are “2-4-6-1-3-5-7”.

modal scale-tone perfect fourths

The tones of the major scale (Ionian mode) can be arranged in an order of perfect fourths by beginning with “7”, creating the sequence “7-3-6-2-5-1-4”. The interval from “4” to “7” is an augmented fourth. The last three numbers, “5-1-4” represent the roots of major triads. The three numbers before them, “3-6-2”, represent the roots of minor triads.

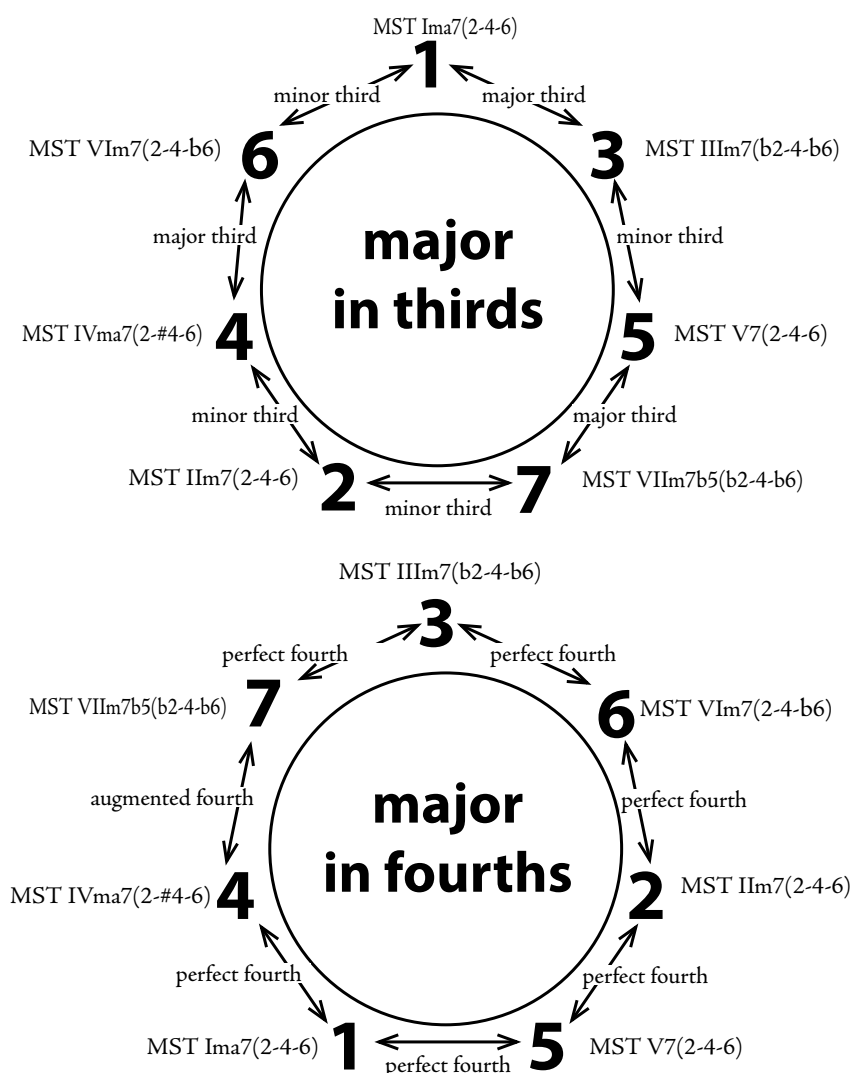

Memorize “7-3-6-2-5-1-4”. Each mode uses the cycle “7-3-6-2-5-1-4-7-3-6-2-5-1-4, etc”, beginning on a specific number and includes its specific alterations. This *perfect fourth series* for each mode must begin with the correct number, which is the root of the diminished triad. Use this formula to find that number: 8 (- mode number) = beginning of perfect fourths. For Mixolydian, which is mode V (5) of the major scale, subtract “5” from “8” and the perfect fourth series begins on III (3). For Dorian (major mode II), subtract “2” from “8” and the perfect fourth series starts on VI (6).

Get the number in mind that begins the perfect fourth series for each mode, then the numbers for the three minor chord roots that follow and the numbers for the major chord roots that follow.

On the table below, the major and minor triads are grouped together when the roots are in perfect fourths. The sequence of perfect fourths begins then with “7” the root of the only diminished triad, then proceeds through the roots of three minor chords “3-6-2” and three major chords “5-1-4”. In the other modes, this same order occurs, but with different numbers:

the perfect fourth series for each major scale mode

<u>triads</u>	<u>diminished</u>	<u>minor</u>	<u>minor</u>	<u>minor</u>	<u>major</u>	<u>major</u>	<u>major</u>

ADDING THE 2, 4 AND 6 TO SEVENTH CHORDS

This shows four-note seventh chords elaborated to larger chords by adding a “2,” “4” or “6” tone. Adding a “2” makes a ninth chord. Adding “2” and “4” makes an eleventh chord. Adding all three tones (“2,” “4” and “6”) makes a thirteenth chord. Not all versions of ninth chords, eleventh chords and thirteenth chords are acceptable to listeners. Various other combinations of “2,” “4” or “6” tones can be added. For all of these possibilities, see [All Scale-Tone Chords](#).

MAJOR AND MINOR II V I CADENCES

The classic major II-V-I cadence is IIm7-V7-Ima7 (Dm7-G7-Cma7), derived from major (Ionian) mode. The classic minor II-V-I cadence is IIm7b5-V7-Im7 (Bm7b5-E7-Am7), derived from a combination of Aeolian mode (on the sixth step of major) and of harmonic minor scale (on the sixth step of major sharp five scale).

Chords are usually voiced with approximately the same number of different notes. Triads have three different notes. Seventh chords have four different notes. Other chords have theoretically as many as seven different notes. Most chords are voiced with three to five different notes, often leaving some of the notes out that are implied by the chord name.

Complete ninth chords have five notes, complete eleventh chords six notes and complete thirteenth chords have seven notes in their complete form. Ninth, eleventh and thirteenth chords usually omit some notes in their voicing so they have four or five different notes. Add-tone chords that break the rule of chord construction in thirds, such as add six (1-3-5-6), add nine (1-3-5-9 <9= 2>), m7/11 (1-b3-5-7-11 <11= 4>) and 9/6 (1-3-5-b7-9-6 <9= 2 and 6=13>) also are usually voiced with three to five different notes.

Since chords usually progress with approximately the same number of notes, they can be thought of as a combination of melodies or *voices*. Chord *voicing* is the choice of notes for each chord that forms a somewhat predictable sequence of notes. The sequence of the lowest notes in a sequence of chords (a chord progression) usually forms a bass melody. The sequence of the highest notes in a sequence of chords usually forms a treble (soprano) melody. Less distinctly, the inner voices do the same. When a note in a voice (such as the bass or soprano) can stay the same, it usually does. Movement is usually preferred by smaller intervals, making the part easier to predict.

Variants of the Major II V I Cadence

Each chord in the cadence is described here with typical voicings. For a more complete list of possibilities, see the chapter in my Theory book called “All Scale-Tone Chords”.

major IIm7 V7 Ima7 basis

The basis of the major II-V-I cadence is part of the sequence of major scale-tone chords with root movement in perfect fourths (7-3-6-2-5-1-4): IIm7-V7-Ima7 (Dm7-G7-Cma7).

IIm7

The II chord in the major II-V-I cadence can be minor or minor seventh with any or all of the tones “2”, “4”, and “6” added. Adding “2” makes IIm9. Adding “4” makes IIm7/11. Adding “2” “4”, and “6” makes IIm13. See “Major Scale-Tone Chords By Type”, column II in [All Scale-Tone Chords](#).

V7

The V chord in the major I-V-I cadence can be major or dominant seventh with any or all of the tones “2”, “4”, and “6” added. Adding “2” to V7 makes V9. Adding “6” to V7 makes V7/6 (V13 no ninth, no eleventh). Adding “2” and “6” to V7 makes V9/6. See “Major Scale-Tone Chords By Type”, column V in [All Scale-Tone Chords](#).

Ima7 or I6

The I chord in the major II-V-I cadence can be major or major seventh with either or both of the tones “2” and “6” added. Adding “2” to Ima7 makes Ima9. Adding “6” to Ima7 makes Ima7/6. The I major triad with “6” added is called I6. Adding “2” and “6” makes Ima9/6. See “Major Scale-Tone Chords By Type”, column I in [All Scale-Tone Chords](#).

Variants of the Minor II V I Cadence

Each chord in the IIIm7b5 V7 Im cadence is described here with typical voicings. For a more complete list of possibilities, see the chapter called “All Scale-Tone Chords”.

major VIIIm7b5 III7 VIIm7 basis

The basis of the minor II V I cadence is part of the sequence of major scale-tone chords with root movement in perfect fourths (7-3-6-2-5-1-4): VIIIm7b5-IIIIm7-VIm7 (Bm7b5-Em7-Am7), but with the IIIIm7 chord usually changed to III7 (VIIIm7b5-III7-VIm7 or Bm7b5-E7-Am7). During the III7 chord, the parent scale is major sharp five.

IIIm7b5

The II chord in the minor II V I cadence is usually m7b5.

V7 (optional b9, #9 and #5)

The V chord in the minor II V I cadence can be major or dominant seventh with any or all of the tones “b2”, “b3” (#2 = #9), and “#5” (= b6) added. Adding “b2” to V7 makes V7b9. Adding “b3” (= #9) to V7 makes V7#9. Replacing the fifth with a “#5” makes V7#5. Adding “#5” to V7 makes V7b13. Possibilities include V7, V7#5, V7#9, V7b9, V7#5#9, V7#5b9, V7#5b9#9.

In terms of a scale on the key scale V chord root, this chord can combine Phrygian (1, b2, b3, 4, 5, b6, b7) and Phrygian major (1-b2-3-4-5-b6-b7).

See “Major Scale-Tone Chords By Type”, column V and “Harmonic Minor Scale-Tone Chords By Type”, column V in [All Scale-Tone Chords](#).

Im or Im7 (rarely Im6)

The Im chord in the major II V I cadence can be minor or minor seventh with either or both of the tones “2” and “4” added. Occasionally, the Im chord is depicted as Im6, changing it from Aeolian mode to Dorian mode. Summertime by George Gershwin used a Im6 as the tonic chord (main chord of the key).

Adding “2” to Im7 makes Im9. Adding “4” to Im7 makes Im7/11. Occasionally, the I minor triad is used with “6” added, called Im6. Adding “2” and “6” makes Im9/6. See “[Major Scale-Tone Chords by Type](#)”, column VI and (less often) column II in [All Scale-Tone Chords](#).

SCALES FOR ALTERED DOMINANT CHORDS

b5..... Mixolydian #4 (Lydian b7, mel. min. mode IV), using the #4 scale tone as a b5 chord tone
#5..... Aeolian Dominant or Mixolydian b6 (melodic minor mode V), using the b6 scale tone as a #5 chord tone
 b5...#5..... whole tone scale (9b5#5)
b9..... Phrygian Dominant or Phrygian Major (harmonic minor V), using the b6 scale tone as a #5 chord tone
#9... Mixolydian in low range of pitch, Dorian in high range (b3 of Dorian serves as a #9)
b9....#9... Diminished half/whole scale (13b9#9#11)
#5...b9..... Phrygian Dominant or Phrygian Major (harmonic minor V), using the b6 scale tone as a #5 chord tone
 b5.....b9....#9... Diminished half/whole scale (13b9#9#11), using the #4 scale tone as a b5 chord tone
 b5...#5...b9....#9... super Locrian or Locrian b4 (melodic minor VII)

SCALES FOR DIMINISHED CHORDS

Modes II, IV, bVI and VII of harmonic minor (or of harmonic major).

Diminished. A diminished seventh arpeggio with a lower chromatic embellishment to each tone in ascending and upper chromatic embellishments in descending.

CHORD ROOTS, TONE CENTERS, KEYS AND CHORD PROGRESSION

What is a Chord Root?

A chord root is the lowest note you can imagine in the sound of a chord. It is the letter after which a chord is named. The letter name of a chord may be followed by a sharp or flat, such as G# or Gb. The sharp symbol indicates a note is played a half step (one fret) higher and a flat indicates it is played a half step lower.

Usually, the notes of a chord can be transposed by octaves to be arranged in consecutive thirds. When a chord is arranged entirely in thirds, the lowest note is usually the root. The first chord below has a “C” note in the bass. When the notes are arranged in thirds, which would be all notes on lines or all on spaces, “F” is the root.

Fma7 Fma7

T 4/4 5
A 4/4 3
B 4/4 3

0
2
3

In some cases, the root is not the lowest note in a series of thirds. Sixth chords have their root as the second-to-lowest tone in a series of thirds. With sixth chords, the lowest root you can imagine may indicate a different root. In the example below, the lowest imaginable root for the D6 chord could be heard as “B”, making the chord a Bm7.

Bm7 D6

T 4/4 5
A 4/4 3
R 4/4 9

What is a Tone Center?

A tone center is the root of the chord you would expect a piece to end on. You would expect a chord progression to end on a chord which gives a feeling of resolution. That chord would be the tonic chord, or main chord in the progression. If the tonic chord is Cm7, the tone center is “C.” If the tonic chord is “Eb7”, the tone center is “Eb.”

The tonic chord (or “main chord”) is the chord you would expect the piece of music to end on. It is the chord which sounds most resolved in a piece of music. A tonic chord is used to give the most final sound at the end of a piece.

I said “you would expect” the piece of music to end on the tonic chord in the previous paragraph, because although the listener expects a song to end on the tonic chord, it doesn’t have to. A song can end with a deceptive cadence (chord sequence) where the final chord is not the tonic chord. This type a ending is intended to “trick” the listener. Although a deceptive cadence does not produce as strong a feeling of resolution, it still can be stimulating. Likewise, songs often begin on the tonic chord, but they don’t have to.

Many recorded pieces of music have a “fade- out” ending. No distinct ending chord is played with a fade-out. I have always hated fade-out endings. I much prefer hearing the ending the band or artist would play in a live performance. The only exception would be where there is some point to fading out, such as the main character in the lyric is walking off into the woods or something of that nature.

The tonic chord can be established by a number of elements in the chord progression, including:

- ✦ Use a tonic chord built on the first step of a well know seven-tone (heptatonic) scale, such as major (Ionian), Dorian, Mixolydian, Aeolian or harmonic minor. The scales which are traditionally used more often produce a stronger tonality, because they are familiar to the listener.
 - a. The tonic chord usually has a strong tonality (is easy to establish as the main chord) in major, Dorian, Mixolydian or Aeolian mode (when major, Dorian, Mixolydian or Aeolian scales are used), in harmonic minor, or in Phrygian major mode (Phrygian scale with a major third).
 - b. The main chord has a passive tonality (somewhat difficult to establish as a main chord) in Phrygian or Lydian mode (when major scale tone three is used as a tone center for Phrygian mode or major scale tone four as a tone center for Lydian mode).
 - c. The main chord has a weak tonality (quite difficult to establish as the main chord) in Locrian mode (when Locrian scale is used).
- ✦ Use a harmonic cadence (chord progression of two or more chords) that is historically known, so the listener expects the tonic chord at the end of the cadence. Most cadences use a chord on the fifth of the intended tonic scale last before the resolution to the tonic chord.

The chord on the fifth of the scale of the intended tonic is commonly a dominant seventh type chord (or altered dominant seventh in jazz). In major mode (also called Ionian), the fifth step of the scale is called dominant, since it has a strong tendency to progress to the tonic (scale tone one). When the intended tonic is not the first step of the parent major scale, the seventh type chord on the fifth of the intended tonic is called a [secondary dominant](#).

In jazz, a [flat five substitute](#) chord replaces the chord on the fifth with one a flat fifth above or below the root of the chord on the fifth of the tonic. The note a flat fifth above or below any given note is the same note. The [flat five substitute](#) becomes a chord built on the upper chromatic neighbor to the tonic, on the root up a half step (one fret) from the root of the intended tonic chord.

- ✦ Long duration or frequent occurrence of the intended tonic chord.
- ✦ **Scalar chord root movement.** A progression of chord roots up or down a scale to the root of the intended tonic chord.
- ✦ **Dissonance.** Preceding the intended tonic chord by one or more dissonant, tension-producing chords.
- ✦ **Low-pitched tonic root.** Use the root of the main chord in a low range of pitch.
- ✦ A [pedal point](#) or **common tone.** Use of the root of the intended tonic chord as a repeating note through a series of chords. A common tone is a note common to all of the chords and usually occurs with the same rhythm as the other chords. A pedal tone is a common tone that occurs consistently in the bass, and takes on the character of an individual voice in the arrangement. An inverted pedal tone occurs in the highest voice.
- ✦ Ending or beginning a section with a chord, where sections are typically multiples of four measures. Ending with the desired tonic chord establishes stronger tonality than beginning with it.

Key

A song is said to be in a key named after the tone center. If the tone center is “A”, the song is said to be in the key of “A”. The key may be further qualified by the scale or mode type, such as “A” major, “A” minor or “A” Mixolydian.

The term “minor” is commonly used loosely in key names where the song may be in any mode which has a minor chord built on the tone center (e.g., Dorian Aeolian or harmonic minor). Likewise, the term major is sometimes used in reference to any mode which has a major chord built on the tone center (e.g., Ionian, Mixolydian, Lydian or Phrygian major).

In the example below, the Am chord sounds resolved at the end. The piece is in the key of A minor.

Treble clef, key signature of one flat (B-flat). The melody consists of four measures. The first measure has a B-flat, the second a B-natural, the third a B-flat, and the fourth a B-natural. The bass line consists of four measures: 2 0 1 3 0 1 0, 4 4 4 3 3 3, 2 0 1 3 0 1 0 5, and 0 1 0 5 0 2. The piece ends with an Am chord.

Elsewhere, in the same piece of music, the section below appears. It has a sense of temporarily being in the key of E major. The specific scale it uses is E Mixolydian flat six (1, 2, 3, 4, 5, b6, b7), but the tonic chord is E, and the primary sound of the scale is E major. The E major chord sounds somewhat resolved at the end of the example, but you might get the sense that the melody is going back to the key of A minor afterward (play the example below, then the example above).

Treble clef, key signature of one sharp (F-sharp). The melody consists of four measures. The first measure has a B-natural, the second a B-natural, the third a B-natural, and the fourth a B-natural. The bass line consists of four measures: 2 4 1 2 0 1 0, 1 1 1 0 1 0, 2 4 1 2 0 1 0, and 1 1 1 0 2. The piece ends with an E chord.

Chord Progression

A chord progression is any sequence of chords. Typically, a chord progression is repeated during a piece of music. Each section of the piece of music (verse, chorus, etc.) may use a different chord progression. Chord progression can combine root movement up or down in stepwise, thirds or fourths order.

RECOGNIZING MODES BY THEIR SOUND IN SONGS

The four common modes are major (Ionian mode), Dorian mode, Mixolydian mode and Aeolian mode, respectively built on steps one, two, five and six of major scales. Of the remaining modes, Lydian on step four and Phrygian on step three are rare. Locrian the mode on step seven of the major scale is very rarely used as a key. See [Modal Key Scale Cycle Diagrams](#).

Determine the Mode for A Song By Listening

happy or sad sound in the scales and chords

If a song sounds happy, it probably is based on a major chord. If a song sounds sad, it is probably based on a minor chord. The general major and minor categories each break down to two common options. A major chord basis could be major scale (also *Ionian*, a seven-tone scale, not just a pentatonic scale) or Mixolydian (a major scale with flat seven). A minor chord basis could be Aeolian or Dorian. Read on.

Mood is determined by the scales that are used, but mood is also determined by other elements of music like tempo and tone. Faster tempos brighten the mood. Slower tempos darken the mood. Clear tone with more treble brightens the mood. Distorted tone with more bass darkens the mood. Of course the lyric affect the mood by the tone of the story.

common scales with a major basis

If you feel the song is happy and therefore likely major, determine if it uses the seven-tone major scale (1-2-3-4-5-6-7) with no altered numbers, or if it uses Mixolydian (1-2-3-4-5-6-b7) with flat seven. The seven-tone major scale and Mixolydian each have major pentatonic as part of them. Minor scales can be changed to have major qualities: minor pentatonic can be played with natural three, making it part of Mixolydian with a *major-sounding* natural three. See [Major \(Ionian mode\)](#) and [Mixolydian mode](#) below.

Lydian is a major scale with a sharp four. Lydian has a major basis since it includes 1-3-5, the notes of a major chord. Lydian mode is rare. See [Lydian Mode](#) below.

common scales with a minor basis

If you feel the song is sad and therefore likely minor, determine if it uses Dorian (1-2-b3-4-5-6-b7) with six or if it uses Aeolian 1-2-b3-4-5-b6-b7) with flat six. Dorian and Aeolian each have minor pentatonic as part of them. Major scales can be changed to have minor qualities: major pentatonic can be played with flat three as part of Dorian, with a *minor-sounding* flat three. See [Dorian mode](#) and [Aeolian mode](#).

Phrygian mode is a major scale with a flat three, flat six and flat seven. Phrygian has a minor basis since it includes 1-b3-5, the notes of a minor chord. Phrygian mode is rare. See [Phrygian mode](#), below.

fingering four common modes in E form

Compare the modes below. Mixolydian has b7, Dorian has b3 and b7. Aeolian has b3, b6 and b7.

major scale

Mixolydian mode

Dorian Mode

Aeolian mode

Major (Ionian Mode)

Ionian mode is the major scale, with the tone center on step one. illustrated by ascending or descending the major scale linearly from step one to one. When it is based on a major triad (major chord), it is happy. See both the [major triad list](#) and the [major seventh list](#) below.

Youth	Daughter	If You Leave

songs in major mode with a major seventh basis include:

All the Things You Are (three keys), Beginnings, Breezin', Fly Me To the Moon, Georgia On My Mind (verse), I Got Rhythm, Imagine, Scrapple From the Apple (section A), September, Stay (Post Malone), Stormy Weather, There Will Never Be Another You, The Way You Look Tonight, Why Does Love Have To Be So Sad (chorus), Witchcraft, You're Still A Young Man, You Are the Sunshine of My Life.

Mixolydian Mode

Mixolydian mode built on the fifth step of a major scale by playing the major scale linearly from step five to five, ascending or descending. Once you build it, you can reconceive it by modifying a major scale on its root and flatting the seventh. The mode built on the fifth step of the C major is G Mixolydian, with the tones G-A-B-C-D-E-F-G. Modifying the G major scale (G-A-B-C-D-E-F#-G) by flatting its seventh (changing F# to F natural), produces the same notes as five to five of the C major scale: G-A-B-C-D-E-F-G.

Mixolydian darkens major by flatting its seventh and makes a bluesier, more funky scale.

Mixolydian songs include (Spotify):

MIXOLYDIAN

title	artist	album

You Wreck Me	Tom Petty	Wildflowers

Lydian mode

Lydian mode is built on the fourth step of a major scale by playing the major scale linearly from step four to four, ascending or descending. Once you build it, you can reconceive it by modifying a major scale on its root and sharpening the fourth. The mode built on the fourth step of the C major is F Lydian, with the tones F-G-A-B-C-D-E-F. Modifying the F major scale (F-G-A-B \flat -C-D-E-F) by sharpening its fourth (changing B \flat to B natural), produces the same notes as four to four of the C major scale: F-G-A-B-C-D-E-F.

Lydian songs include:

Dreams (Fleetwood Mac), Freewill, Flying in a Blue Dream, Blue Jay Way (alternates Lydian diminished and Lydian), Eleanor Rigby (the “C” chords), Golden Lady (bars 3-4, 7-8 of chorus), Maria, Donna Lee bars 3-4 key scale (Mixolydian b6 chord scale),

Dorian mode

Dorian mode is built on the second step of a major scale by ascending or descending the major scale from step two to two. It has the brightest mood of all minor modes. Once you build it on the second step of a major scale, you can reconceive it by flattening the third and seventh steps of a major scale named after it. C major scale from D to D produces D Dorian. Modifying the D major scale (D-E-F \sharp -G-A-B-C \sharp -D) by flattening its third (F \sharp to F natural) and flattening its seventh (changing C \sharp to C natural), produces the same notes as two to two of the C major scale: D-E-F-G-A-B-C-D. In addition to being the basis of the Dorian songs listed below, Dorian is used in major key blues to darken the sound of seventh chords, such as using D Dorian with its D minor basis on a blues based on a D major chord. The typical, simple major key blues in D uses the chord progression D-D-D-D-G-G-D-D-A-G-D-A). Try playing the D Dorian scale over it (D-E-F-G-A-B-C-D).

Dorian songs include (Spotify):

Mixolydian and Dorian hybrid

Songs often use a hybrid of Mixolydian and Dorian, usually based on a I7#9 chord. Examples include Are You Gonna Be My Girl, Black Friday, Born to Be Wild, Chain of Fools, Chank, Cissy Strut, Don't You Worry 'Bout A Thing, Foxey Lady, Get Back. Livin' For the City, Living in the U.S.A., Purple Haze, Roadhouse Blues, Taxman, What Is Hip?, You Got to Funkafize.

Major Key Blues Modes

Blues in a major key usually uses Mixolydian throughout, except Dorian on the IV chord. See [Modes On I-IV-V Blues](#) and [Modes On Jazz Blues](#). During the I and V chords, Dorian can be used in place of Mixolydian to darken the mood.

Aeolian mode (natural minor)

Aeolian mode is built on the sixth step of a major scale by ascending or descending linearly from major scale tone six to six. It is the traditional sad mode. Once you build it on the sixth step of a major scale, you can then reconceive it by modifying a major scale on its tone center and flattening the third, sixth and seventh. Minor keys can be made to sound happier by using a lively rhythm, like Hava Nageela or Stray Cat Strut.

Aeolian songs include (Spotify):

Phrygian mode

Phrygian mode is built on the third step of a major scale by ascending or descending linearly from major scale tone three to three. Once you build it on the third step of a major scale, you can then reconceive it by modifying a major scale on its tone center and flattening the second, third, sixth and seventh. It is the darkest mode of the major scale that is based on a minor chord.

Phrygian songs include:

Miserlou, Would?, Space Oddity, Wherever I May Roam, Set the Controls for the Heart of the Sun, London Calling, The Ocean.

RELATIVE MINOR AND RELATIVE MAJOR

Tone centers of scales or keys and roots of chords or arpeggios are all usually circled in this course. To show relative and parallel major and minor scales, squares are used here in this section for minor tone centers and circles are used for major tone centers.

Relative Major and Minor Pentatonic

Each common pentatonic scale fingering can be used for a minor key and a major key. Pentatonic fingering 1 is shown below. On the far left, “fingers” shows fingering 1 in fifth position, with the numbers “1”, “3” and “4” shown to indicate the index, ring and little fingers, respectively. Next to the left, is “A minor pentatonic”, using the same notes in fifth position, but indicating that the key is on the “squared” notes, “A”. Next, “C major pentatonic” is again the same notes, but the circled “C” notes show C as the key.

Relative A minor and C Major Pentatonic Scales

duality tones

Notes that are in a key scale (a scale named after the key) and the current chord are **duality tones**. Duality tones satisfy the constant reference to the key by being notes in the key scale. At the same time they make reference to the current chord, so the listener can hear the relationship between the key and the current chord.

In the melodic examples “A minor pentatonic and C major pentatonic, shown above, the letter names (A, B, C, etc.) of the notes are shown in the white space between the music notation and the tablature. In the example in A minor, the notes of the A minor chord A-C-E predominate, establishing A minor as the key. In the C major example, the notes C-E-G predominate, establishing C major as the key.

Parallel Major and Minor Pentatonic

parallel major and minor in the same position with different fingerings

By using different pentatonic scale fingerings, major and minor pentatonic can be played in the *same* key. Major and minor scales in the same key are called parallel major and minor.

Parallel C minor and C Major Pentatonic Scales

fingers pentatonic scale fingering 1 V	fingers pentatonic scale fingering 1 VIII	C major pentatonic ("C's" in circles) fingering 1 V	C minor pentatonic ("C's" in aquares) fingering 1 VIII

parallel major and minor with the same fingering, changing position

Wherever you play a particular minor pentatonic fingering on the fretboard, moving the fingering toward the head of the guitar three frets changes the same key to major. Conversely, wherever you play a particular major pentatonic fingering on the fretboard, moving the fingering toward the body of the guitar three frets changes the same key to minor.

In the Hound Dog example below, the improv in the second bar is C major pentatonic, fingering 1 in fifth position, where the low octave tone center is under the little finger on the sixth string, eighth fret. Improv in the third bar also uses pentatonic fingering 1, but in C minor by placing the index finger on the minor tone center on the sixth string at the eighth fret.

Key Signatures and the Relative Minor-Relative Major System

From 1600 to 1900, in the common practice period of classical music, songs primarily used major scales with the key on the first step (C of the C major scale) or on the sixth step ("A" of the C major scale). Using the C major scale, this would produce either C major or A Aeolian (also called A natural minor). A Aeolian is the *relative minor* of C major. Conversely, C major is the *relative major* of A Aeolian, although the term *relative major* is less common than relative minor.

This major and relative minor system was expressed in our current key signature system. A key signature is a set of flats or sharps shown in the standard music notation at the beginning of a piece of music to indicate what notes should be altered to produce the desired major scale. C major has no sharps or flats.

Using the five major scale fingerings below, play many of the major and minor scales at the right. Locate "1" on the major scale fingerings below on a major tone center, or locate "6" on the major scale fingerings below on a minor tone center. For example, play fingering 6 and locate the C note on "1" on the sixth string (in the fifth position with the little finger on the sixth string, eighth fret "C"). Play up and down the scale from "1" to "1" to sound the C major scale. Fingering 6 in the fifth position would also make A minor (A Aeolian) with the index finger fret C major scale tone six, the "A" note on the sixth string. Play up and down the scale from "6" to "6" to sound the A Aeolian (A natural minor) scale.

KEY SCALE, PARENT SCALE AND CHORD SCALE

Key Scale

Key scales are named after the tone center. They may vary by type when used in a particular piece of music, but would have a tone center in common. A melody in the key of C may use C major, C Mixolydian and C Dorian. All three of these scales share the tone center, “C”, so they would be *key scales* for the key of “C”.

Melody more often makes use of scales named after the key, rather than the chord. It is easier for the listener to follow a melody if it is all (or primarily) based on the tone center. A piece of music in the key of “E” with the chord progression Em7 A7 Cma7 B7 sus. 4 may use an E Dorian scale (E Dorian mode) during the Em7 and A7 chords and E Aeolian scale during the Cma7 and B7sus4 chords.

Parent Scale

A *parent scale* is a reference scale from which a scale or mode was derived. Most commonly, a major scale is used as a parent scale. Any of the modes of the major scale would refer to that major scale (which was their source) as their parent scale. Other parent scales are *major #5*, *major b3* and *major b6*, each of which have seven modes like the major scale and are simple modifications of the major scale.

C major scale uses the notes C, D, E, F, G, A, B and C. Modes are constructed on each of the tones of the C major scale. The [Discovering Major Scale Modes](#) section earlier in this chapter demonstrated modes of the C major scale. Those modes all have the C major scale as their parent scale.

In the example below, play the C major scale from the sixth string to the first string. It will be the parent major scale. Now play the notes from “D” to “D”, followed by the D minor triad (three-note chord), to emphasize the chosen note as a focal point or main note. This establishes a new scale, “D Dorian”.

Follow the same procedure with “E” to “E” for E Phrygian, “F” to “F” for F Lydian, and so on. You have now experienced all the modes of the C major parent scale.

C major parent scale

D Dorian mode on "2" of the parent C major scale Dm E Phrygian mode on "2" of the parent C major scale Em

D-F-A E-G-B

The image displays four musical examples, each consisting of a treble clef staff with a melody, a bass staff with fingerings, and a chord symbol above the staff.

- Example 1:** F Lydian mode on "4" of the parent C major scale. Chord: F. Bass staff fingerings: 5 7 4 5 7 5 6 | 5 7 5 4 7 5 6 | 6 5 7 4 5 7 5 6 8 | 6 5 7 5 4 7 7.
- Example 2:** G Mixolydian mode on "5" of the parent C major scale. Chord: G. Bass staff fingerings: 5 7 4 5 7 5 6 8 | 6 5 7 5 4 7 7.
- Example 3:** A Aeolian mode on "6" of the parent C major scale. Chord: Am. Bass staff fingerings: 7 4 5 7 5 6 8 5 | 8 6 5 7 5 4 5 | 4 5 7 5 6 8 5 7 | 5 8 6 5 7 5 7.
- Example 4:** B Locrian mode on "7" of the parent C major scale. Chord: Bdim. Bass staff fingerings: 5 7 4 5 7 5 6 8 | 6 5 7 5 4 7 7.

Chord Scale

When a scale is named after a chord root which is not the key, it is called a *chord scale*. Key scales keep the tone center as the object of the melody. As the melody progresses with key scales, the tone center is common to all of the scales and the melody weaves around and leads to the tone center. Chord scales tend to take the focus off of the tone center and can cause a loss of purpose in the melody.

When a chord has a long duration and its root is not the tone center, it can be treated as a temporary tone center. In this case, a chord scale can be used. The chord scale would usually include all of the notes of the chord, although it doesn't have to. In choosing a chord scale, first think of the triad part of the chord. Do the root, third and fifth of the chord make a major, minor, diminished or augmented triad? Or, is it a suspended chord with a fourth or second that replaces the third? What kind of seventh or sixth does the chord have (if any)?

In the example above, the chord progression Em7 A7 Cma7 B7sus4 was suggested, in the key of "E". A chord scale could be used for each chord. E Dorian scale during the Em7 chord, A Mixolydian during the A7, C Lydian scale during the Cma7 and B Phrygian major scale during the B7sus4.

E Dorian and A Mixolydian have the same notes. They are both derived from the D major scale. By thinking of them as "A" and "A" scales you would tend to shift the weight of the melody from "E" to "A", where it might be better to keep the focus of the melody on "E". C Lydian scale could be used during the Cma7 chord, but E Aeolian has the same notes and would keep the focus on the tone center ("E"). Likewise, B Phrygian major scale could be thought of as E harmonic minor.

This can all seem too complicated, but the point is to begin by thinking of a type of scale named after the key which has most or all of the notes of the current chord. If any of the notes of a key scale conflict with a chord, they can be de-emphasized. Conflict is not necessarily bad, though. Notes that have varying degrees of dissonance with a chord can be used effectively to create tension and release during the course of a melody.

MODES: ALTERNATE TONE CENTERS OF A SCALE

Earlier, [Relative Major and Minor Pentatonic](#) showed that A minor pentatonic and C major pentatonic used the same notes, yet could each establish their own key (A minor and C major). Similarly, the seven-tone major scale can be used in the same manner. Any tone of the major scale can be the key. To demonstrate that, seven examples are shown below, each using the notes of the C major scale, but each in a different key, with a key on a different note of the C major scale. The mode names originated in Greece. *Modus* means mood in Greek, so each mode represents its own mood.

All of these examples use the C major scale, but each one puts the focus or tone center on a particular note. D Dorian, for example, is the C major scale with the focus or tone center on “D”.

table of modes of the C major scale

C major (Ionian mode)Ode To Joy - [click to play video](#)

The image displays a musical score for the song "Ode To Joy" in C major (Ionian mode). The score is written for guitar and includes a standard musical staff with a treble clef and a 2/4 time signature. The key signature is one sharp (F#), indicating C major. The score is divided into four systems, each containing a musical staff and a corresponding guitar TAB. The TAB is written on a six-line staff with numbers 0-3 representing frets. The score includes various chords and melodic lines, with some measures containing triplets. The chords are labeled as C, F, G7, Am, D7, and C. The score is numbered 1 through 12, indicating measures. The TAB is written in a way that corresponds to the notes on the musical staff.

DISCOVERING THE MODES OF THE C MAJOR SCALE

The alternate scale names for C major scale tones were demonstrated in the previous section [Modes: Alternate Tone Centers of a Scale](#). Each of the seven pieces in [The C Major Scale Common to Seven Examples](#) uses a scale with a different scale name: C major, D Dorian, E Phrygian, F Lydian, G Mixolydian, A Aeolian and B Locrian. Yet all seven of them used the same notes as the C major scale: A-B-C-D-E-F-G.

A key implies the sense of a primary focal tone that is the lowest imaginable bass note of an expected ending chord in the traditional sense. A piece of music in the key of C major is expected to end on a C major chord with a “C” bass note. A piece in the key of A minor is expected to end in the key of on an A minor chord with an “A” bass note. The note after which a key is named is called the *tone center* or *tonic*.

Particularly when alternate tone centers such as those demonstrated in [The C Major Scale Common to Seven Examples](#) establish a key, they are called *modes*. Modus is the Greek word for mood. The Greeks used seven tone scales with the option of any of the seven tones being the tone center. The modes of the C major scale are shown below, played in the traditional manner ascending from the tone center to the tone center in the next octave and descending back down to the lower tone center. The chord at the end of each mode demonstrates the expected ending chord. Click to play the video so you can hear the establishment of each key.

The Modes of C Major - [click to play video](#)

The Parent C Major Scale

The notes of each examples in [The C Major Scale Common to Seven Examples](#) were from the same set of notes, the C major scale, as were the notes of [The Modes of C Major](#) above. So, C major could be called the *parent scale*, since it is the source of all the notes. Parent scale is a very useful concept, usually referring to a major scale as the parent, since we usually know major scale fingerings and the harmonies and chords built on them better than any of the other modes. See Key Scale, Parent Scale and Chord Scale.

Discovering the Modes of the C major Scale, Step By Step

Playing the C major scale from scale tone “1” to “1” (C to C), in numeric and alphabetical order constitutes the C major scale, or using the Greek name, C *Ionian*. By playing a major scale up and down an octave in numerical and alphabetical order from any particular numbered tone (or lettered tone) to the next occurrence of the same note and back implies a *mode*.

The etymological origin of the word mode in English is the Greek word *modus*, which means *mood*. Each note in the major scale can be used as a tone center. The octave from each note up and down to its next occurrence and back produces a different scale, each scale with a different mood. So these scales are called modes. The seven modes of the major scale are shown below.

To further define the emotive character of each mode, consider an triad (three note chord) constructed on the note after which the mode is named and including two more notes in an every-other-note pattern. The qualities (major, minor or diminished) of the triads constructed on the seven steps of the major scale are shown in the right column below.

mode name	mode formula	generated from the C major scale	triad name
I Ionian	1-2-3-4-5-6-7	C-D-E-F-G-A-B-C	C major
II Dorian	1-2-b3-4-5-6-b7	D-E-F-G-A-B-C-D	D minor
III Phrygian	1-b2-b3-4-5-b6-b7	E-F-G-A-B-C-D-E	E minor
IV Lydian	1-2-3-#4-5-6-7	F G-A-B-C-D-E-F	F major
V Mixolydian	1-2-3-4-5-6-b7	G-A-B-C-D-E-F-G	G major
VI Aeolian	1-2-b3-4-5-b6-b7	A-B-C-D-E-F-G-A	A minor
VII Locrian	1-b2-b3-4-b5-b6-b7	B-C-D-E-F-G-A-B	B diminished

To discover the modes of the major scale, we will compare major scales named after each note of the C major scale to the C major scale starting on that note.

D Dorian: Mode II of C Major

The C major scale is the parent scale for D Dorian, because Dorian is built on step two of a major scale and the C major scale has “D” on its second step. Ascend the C major scale from “D” to “D” (“2” to “2”) and back. This is the D Dorian mode. In the same fretboard area, ascend and descend the D major scale from “1” to “1” and flat tones three and seven. The result is the same as D to D (2 to 2) of the C major scale.

comparing C major scale from D to D (2 to 2) and D major scale with b3 and b7

C major scale by letter	C major scale by number	C major scale from D to D	C major scale from 2 to 2	D major scale	D major scale with b3 and b7
C ma. scale VII	C ma. scale VII	D Dorian VII	D Dorian VII	D ma. scale VII	D Dorian VII
B E A D B C F G C B E D G C F A D	7 3 6 2 7 1 4 5 1 7 3 2 5 1 4 6 2	E A (D) F B D G C	3 6 (2) 4 7 2 5 1	2 5 (1) 3 6 1 4 7	2 5 (1) b3 6 1 4 b7

D Dorian mode is C major scale D to D (2 to 2) or D major scale with b3, b7

Notice that to make the D major scale the same as playing the C major scale from “D” to “D”, the third and seventh steps have to be lowered. So, Dorian mode, named after step two of a major scale has “b3” and b7” in relation to a major scale on its tone center (a major scale named after step two of the parent major scale).

D major scale

E Phrygian: mode III of C major

The C major scale is the parent scale for E Phrygian, because Phrygian is built on step three of a major scale and the C major scale has “E” on its third step. Ascend the C major scale from “E” to “E” (“3” to “3”) and descend back down. This is the E Phrygian mode. In the same fretboard area, ascend and descend the E major scale from “1” to “1” with b2, b3, b6 and b7. The result is the same as E to E (3 to 3) of the C major scale.

E Phrygian mode is C major scale E to E (3 to 3) or E major scale with b2, b3, b6, b7

Notice that to make the E major scale the same as playing the C major scale from “E” to “E”, steps two, three, six and seven have to be lowered. So, Phrygian mode, named after step three of a major scale has “b2, b3, b6 and b7” in relation to a major scale on its tone center (a major scale named after step three of the parent major scale).

E major scale

F Lydian: mode IV of C major

The C major scale is the parent scale for F Phrygian, because Lydian is built on step four of a major scale and the C major scale has “F” on its fourth step. Ascend the C major scale from “F” to “F” (“4” to “4”) and descend back down. This is the F Lydian mode. In the same fretboard area, ascend and descend the F major scale from “1” to “1”, sharpening the fourth step. The result is the same as F to F (4 to 4) of the C major scale.

F Lydian mode is C major scale F to F (4 to 4) or F major scale with #4

Notice that to make the F major scale the same as playing the C major scale from “F” to “F”, step four needs to be raised. So, Lydian mode, named after step four of a major scale has “#4” in relation to a major scale on its tone center (a major scale named after step four of the parent major scale).

F major scale

G Mixolydian: mode V of C major

The C major scale is the parent scale for G Mixolydian, because Mixolydian is built on step five of a major scale and the C major scale has “G” on its fifth step. Ascend the C major scale from “G” to “G” (“5” to “5”) and descend back down. This is the G Mixolydian mode. In the same fretboard area, ascend and descend the G major scale from “1” to “1”, flattening the seventh step. The result is the same as G to G (5 to 5) of the C major scale.

B Locrian: Mode VII of C Major

The C major scale is the parent scale for B Locrian, because Locrian is built on step seven of a major scale and the C major scale has “B” on its seventh step. Ascend the C major scale from “B” to “B” (“7” to “7”) and descend back down. This is the B Locrian mode. In the same fretboard area, ascend and descend the E major scale from “1” to “1” with b2, b3, b5, b6 and b7. The result is the same as B to B (7 to 7) of the C major scale.

C major scale by letter	C major scale by number	C major scale from B to B	C major scale from 7 to 7	B major scale	B major scale with b2, b3, b5, b6, b7
C ma. scale VII	C ma. scale VII	B Locrian VII	B Locrian VII	B ma. scale VII	B Locrian VII

B Locrian mode is C major scale B to B (7 to 7) or B major scale with b2, b3, b5, b6, b7

Notice that to make the B major scale the same as playing the C major scale from “B” to “B”, steps two, three, five, six and seven need to be lowered (all but one and four). So, Locrian mode, named after step six of a major scale has “b2, b3, b5, b6, and b7” in relation to a major scale on its tone center (a major scale named after step six of the parent major scale).

B major scale

DISCOVERING THE PARENT SCALE FOR A GIVEN MODE

A Tone Center As a Different Numbered Tone In Seven Major Scales

Any given tone center can occur on any step of a major scale. It can occur on step one of one unique major scale, on step two of another unique major scale, and so on. The tone center “A” occurs on:

- ✦ step one of an A major scale
- ✦ step two of a G major scale
- ✦ step three of an F major scale
- ✦ step four of an E major scale
- ✦ step five of a D major scale
- ✦ step six of an C major scale
- ✦ step seven of a Bb major scale

For any given letter, you could find the seven major scales in which it occurs in the table below. In each of the seven major scales, it is a different numbered tone, as with the list of modes of the note “A” above.

Table of Modes of Parent Major Scales

scale tone →	1	2	3	4	5	6	7
mode formula →	1-2-3-4-5-6-7	1-2-b3-4-5-6-b7	1-b2-b3-4-5-b6-b7	1-2-3-#4-5-6-7	1-2-3-4-5-6-b7	1-2-b3-4-5-b6-b7	1-b2-b3-4-b5-b6-b7
mood →	bright, happy	dark, some bright colors (2 and 6)	dark, dramatic	bright, exotic	bright, bluesy	dark, sad	dark, evil
styles →	all styles	blues, latin rock	flamenco, middle-eastern	jazz, progressive rock, art rock	blues, funk, rock	all styles	death metal, art rock
parent scale ↓	major scale (Ionian mode)	Dorian mode	Phrygian mode	Lydian mode	Mixolydian mode	Aeolian mode	Locrian mode
C major scale	C Ionian	D Dorian	E Phrygian	F Lydian	G Mixolydian	A Aeolian	B Locrian
F major scale	F Ionian	G Dorian	A Phrygian	Bb Lydian	C Mixolydian	D Aeolian	E Locrian
Bb major scale	Bb Ionian	C Dorian	D Phrygian	Eb Lydian	F Mixolydian	G Aeolian	A Locrian
Eb major scale	Eb Ionian	F Dorian	G Phrygian	Ab Lydian	Bb Mixolydian	C Aeolian	D Locrian
Ab major scale	Ab Ionian	Bb Dorian	C Phrygian	Db Lydian	Eb Mixolydian	F Aeolian	G Locrian
Db major scale	Db Ionian	Eb Dorian	F Phrygian	Gb Lydian	Ab Mixolydian	Bb Aeolian	C Locrian
Gb major scale	Gb Ionian	Ab Dorian	Bb Phrygian	Cb Lydian	Db Mixolydian	Eb Aeolian	F Locrian
G major scale	G Ionian	A Dorian	B Phrygian	C Lydian	D Mixolydian	E Aeolian	F# Locrian

F# major scale	F# Ionian	G# Dorian	A# Phrygian	B Lydian	C# Mixolydian	D# Aeolian	E# Locrian

Determine the Parent Scale by a Memory of Major Scales

If you have memorized the names of the notes in each of the major scales well enough, you may be able to browse your memory and determine the scale on which a particular letter name occurs on any step you want. You may be able to think the note “Db” and know that it is the fourth step of an Ab major scale to construct Db Lydian. If you cannot do that at this time, don’t worry, many others cannot either. Use the method below to determine the parent by major scale fingerings.

Determine the Parent Scale with Major Scale Fingerings

determine the name of the parent scale

Determine the key and the mode you want to play, then determine the parent scale by playing the numbered tone on which the mode is built in any major scale. Count up or down the major scale, by the shortest route and go to step “one”. The letter name on step one is the name of the parent major scale. Phrygian mode is built on the third step of a major scale. If you want to play D Phrygian mode, begin on tone three of a major scale fingering and progress in numbered order to step one by the shortest route. Locate the fingering below where the numbered tone “3” is on the note “D”. That would be at the fifth fret, where the top note of the diagram is a the fifth fret.

Then progress to step one. Go down the scale, in descending numbers. It is only two numbers down to one, but six (inclusively) up to one. Name the note “1”. It could be called “A#” or “Bb”. If you look at the Table of Modes of Parent Major Scales, in the parent scale column on the left, you’ll see that most major keys name notes with an altered letter use flats, rather than sharps. F# and Gb are both used, though they are the same note. So, call it “Bb”. The parent scale for D Phrygian is “Bb” major.

Figure out another parent scale. Aeolian mode is build on step six of a major scale. If you want to play C# Aeolian mode, begin on tone six of a major scale fingering and progress in numbered order to step one by the shortest route. Locate the fingering below where the numbered tone “6” is on the note “C#”. That would be at the ninth fret, where the top note of the diagram is a the ninth fret.

Then progress to step one. Go up the scale, in ascending numbers to step one. Name the note “1”. It would be “E”. So the parent scale for E Aeolian is “E” major.

determine the most suitable fingering of the parent scale

Determine the tone center and mode you want. Then figure out its parent scale, as described in [Determine the Parent Scale with Major Scale Fingerings](#). Once you figure out the name of the parent scale, decide where to play it on the fretboard. Choose an area of the fretboard where you want to play the parent scale of the mode. Decide between the options in that area, according to ease of fingering for the whole scale and for subset pentatonic scales, arpeggios and melodic designs you wish to play in the area.

The diagrams illustrate various scale fingerings for modes, organized into three columns:

- Left Column:** Fingerings 1 through 6, each showing a sequence of notes and fingerings across the fretboard.
- Middle Column:** A large set of diagrams, including a central one with a circled '1' and '4' on the first string, and others with circled '1' and '5'.
- Right Column:** Fingerings 1/2, 3, 4/5, and 7, each showing a sequence of notes and fingerings across the fretboard.

Mood Cycles and Major Scale Fingering Cycles

In this section, you will learn how to play any major scale mode in any key. You will need to do the following:

- memorize the seven in-position major scale fingerings
- memorize the mood cycle for major scale modes
- memorize the fingering cycle for in-position major scales to coordinate with the mood cycle of major scale modes

the seven in-position major scale fingerings

These are numbered according to the number of the lowest pitch on the sixth (largest) string. Fingering 3, for example has major scale tone “3” as its lowest pitch. That would be C major scale fingering 3 in the twelfth position, where the lowest pitch on the sixth string is “E”, the third step of the C major scale. Here are the seven in-position fingerings in numerical order:

fingering 1	fingering 2	fingering 3	fingering 4	fingering 5	fingering 6	fingering 7

The best order to memorize the fingerings in is 7-3-6-2-5-1-4, as shown below. You could memorize one a week for seven weeks. Learn how to use each “fingering of the week” in different modes and with pentatonic and arpeggio subsets so you reinforce the memory. 7-3-6-2-5-1-4 is also the number cycle for moods from the mode with the darkest mood to the mode with the brightest mood. See the mood cycle for major scale modes, below.

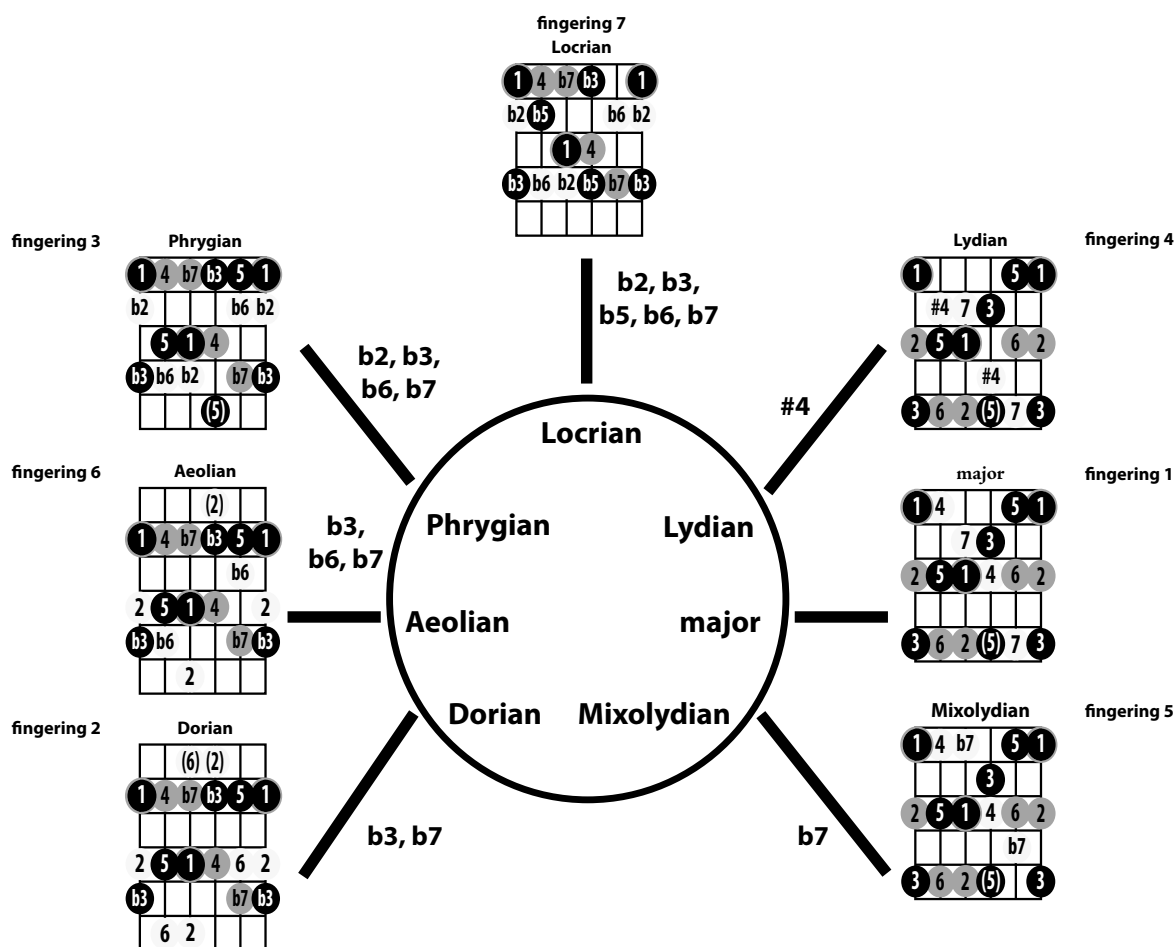

fingering 7	fingering 3	fingering 6	fingering 2	fingering 5	fingering 1	fingering 4

the mood cycle for major scale modes

To play a series of major scale fingerings to represent the seven modes of the same note, play each of the seven fingerings so the desired tone center is on the same string, fretted with the same finger. For

example, play the seven modes of “A” with the note “A” fretted on the sixth (largest) string with the index finger. In the sets of fingerings below, that would be “6-1”, indicating the tone center is on the sixth string fretted with the first (index) finger.

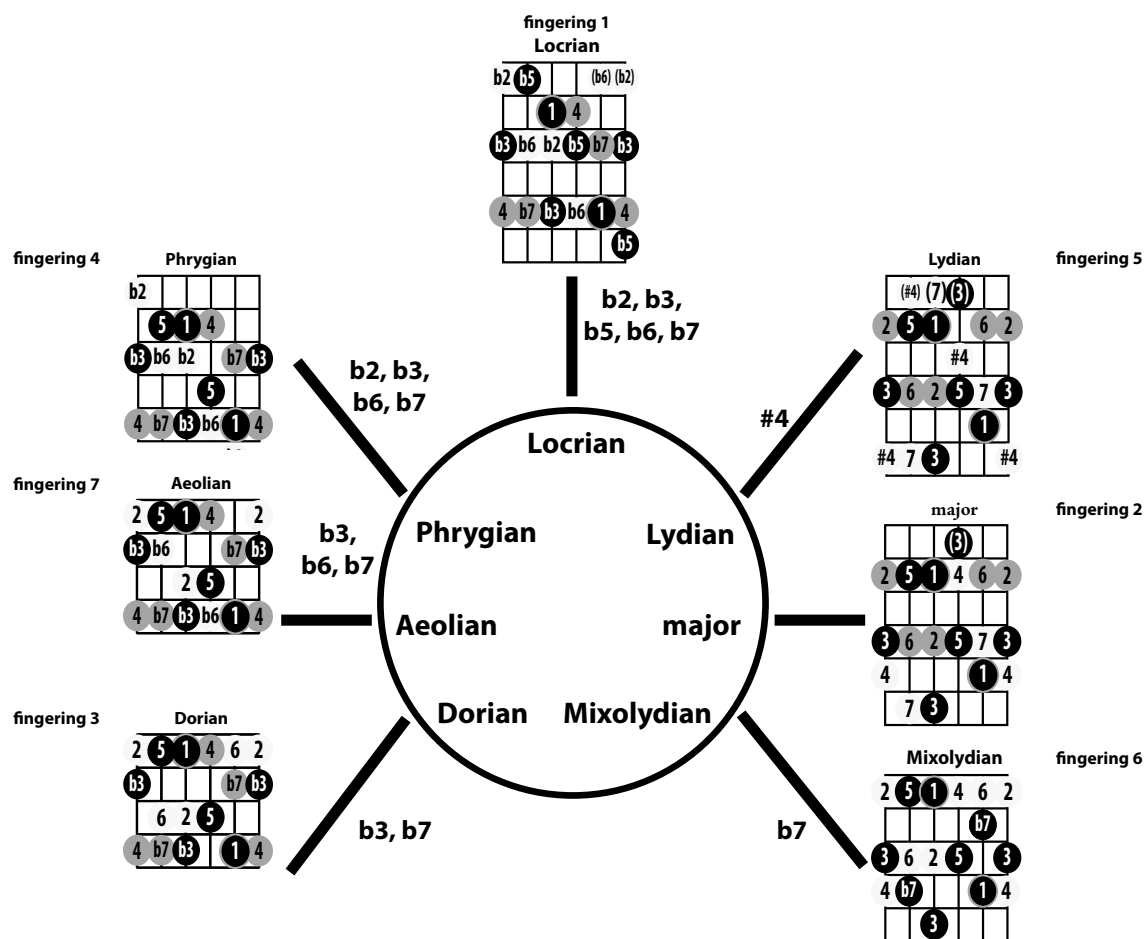

major scale modes, fingering 6-1

To play the modes above all in the key of “A”, play them with the “1” on the sixth string on the note “A”. The “A” note would be at the sixth string, fifth fret, fretted with the index finger (1). That would produce the following darkening cycle of major scale modes, going around the circle counter-clockwise:

major scale fingering	mode	location in parent major scale	altered tones of key scale
7	Locrian	step 7 of Bb major scale	A major scale with b7, b3, b6, b2, b5
3	Phrygian	step 3 of F major scale	A major scale with b7, b3, b6, b2
6	Aeolian	step 6 of C major scale	A major scale with b7, b3, b6
2	Dorian	step 2 of G major scale	A major scale with b7, b3
5	Mixolydian	step 5 of D major scale	A major scale with b7
1	major (Ionian)	step 1 of A major scale	A major scale unaltered
4	Lydian	step 4 of A major scale	A major scale with #4

major scale modes, fingering 4-1

To play the modes above all in the key of "A", play them with the "1" on the fourth string on the note "A", fretted with the index finger (1). The "A" note would be at the fourth string, seventh fret. That would produce the following darkening cycle of major scale modes, going around the circle counter-clockwise:

major scale fingering	mode	location in parent major scale	altered tones of key scale
1	Locrian	step 7 of Bb major scale	A major scale with b7, b3, b6, b2, b5
4	Phrygian	step 3 of F major scale	A major scale with b7, b3, b6, b2
7	Aeolian	step 6 of C major scale	A major scale with b7, b3, b6
3	Dorian	step 2 of G major scale	A major scale with b7, b3
6	Mixolydian	step 5 of D major scale	A major scale with b7
2	major (Ionian)	step 1 of A major scale	A major scale unaltered
5	Lydian	step 4 of A major scale	A major scale with #4

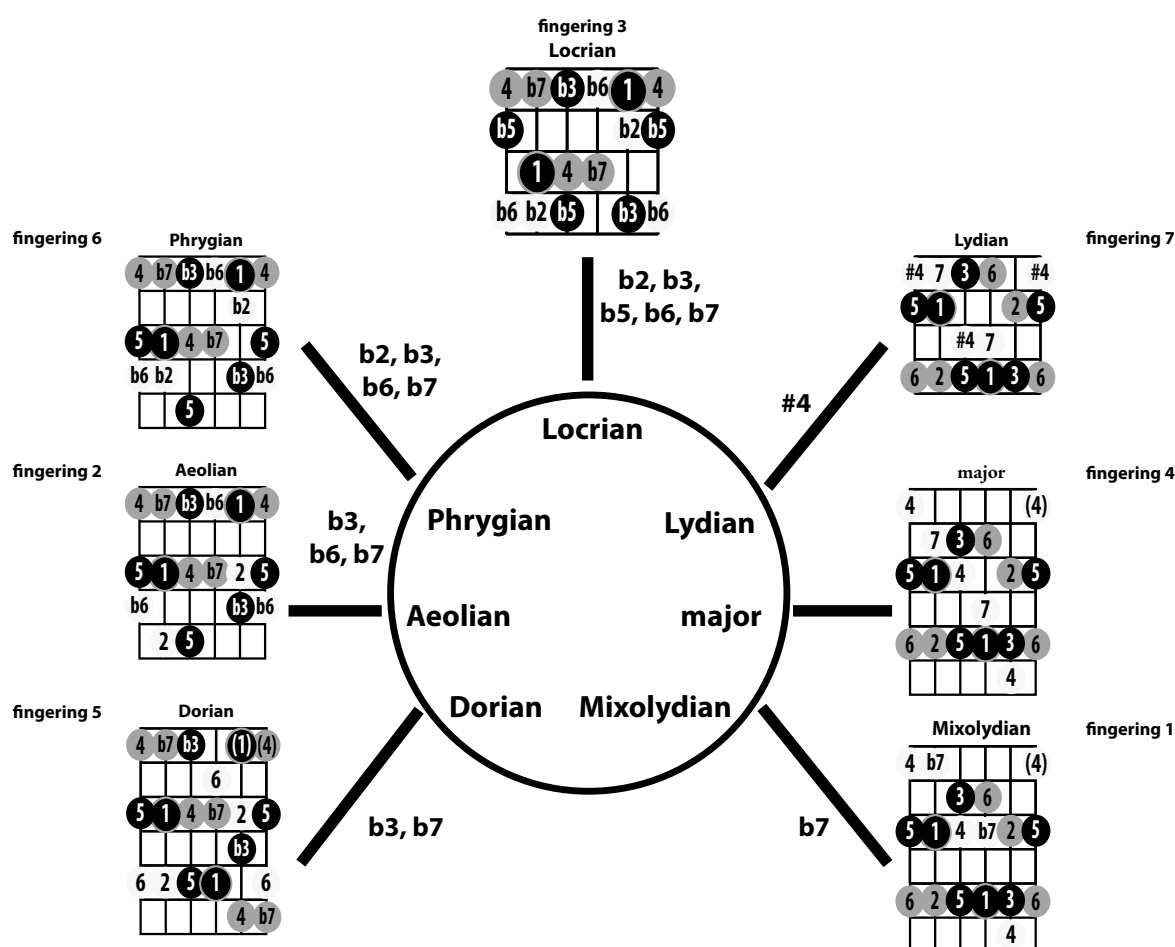

major scale modes, fingering 5-4

To play the modes above all in the key of “A”, play them with the “1” on the fifth string on the note “A”, fretted with the little finger (4). The “A” note would be at the fifth string, twelfth fret. That would produce the following darkening cycle of major scale modes, going around the circle counter-clockwise:

major scale fingering	mode	location in parent major scale	altered tones of key scale
2	Locrian	step 7 of Bb major scale	A major scale with b7, b3, b6, b2, b5
5	Phrygian	step 3 of F major scale	A major scale with b7, b3, b6, b2
1	Aeolian	step 6 of C major scale	A major scale with b7, b3, b6
4	Dorian	step 2 of G major scale	A major scale with b7, b3
7	Mixolydian	step 5 of D major scale	A major scale with b7
3	major (Ionian)	step 1 of A major scale	A major scale unaltered
6	Lydian	step 4 of A major scale	A major scale with #4

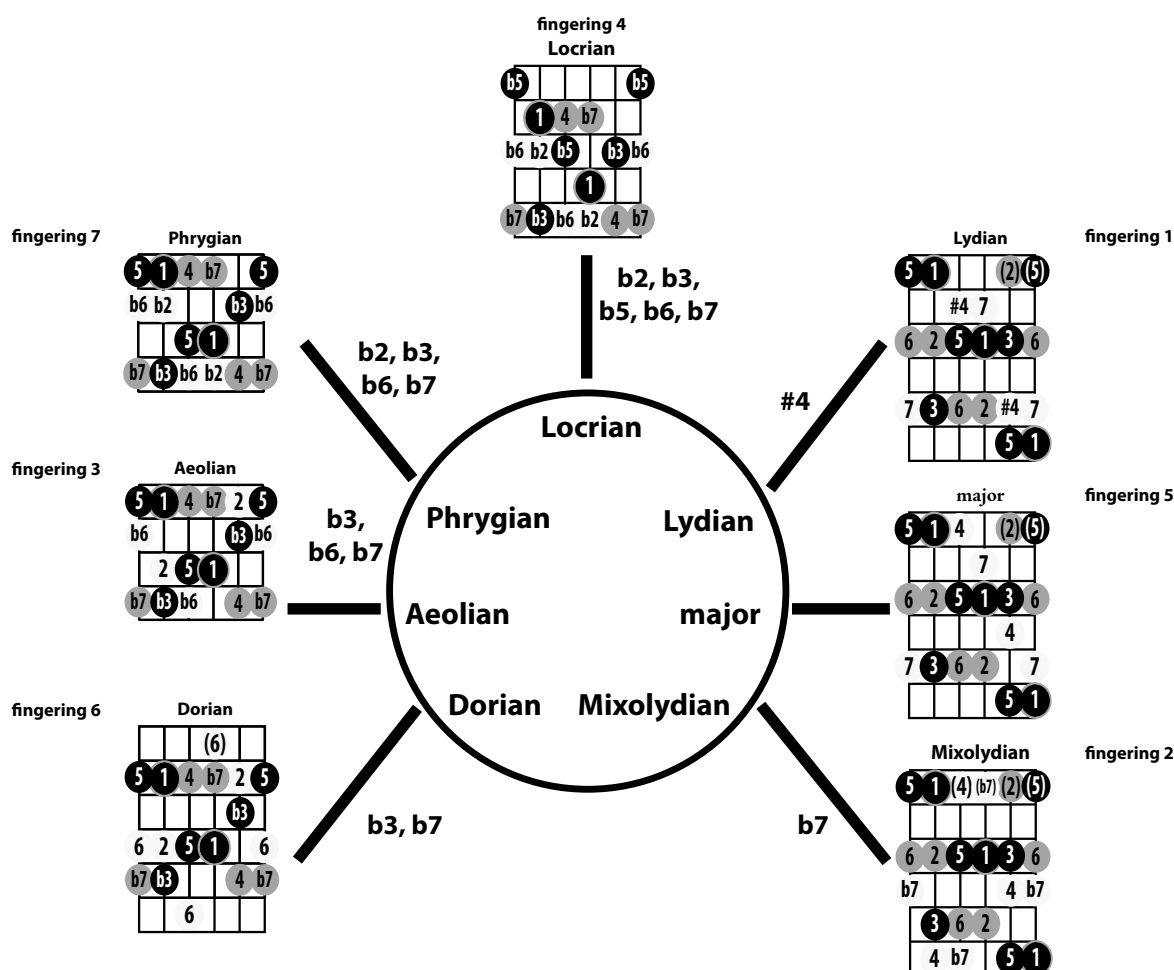

major scale modes, fingering 5-2

To play the modes above all in the key of "A", play them with the "1" on the fifth string on the note "A", fretted with the middle finger (4). The "A" note would be at the fifth string, twelfth fret. That would produce the following darkening cycle of major scale modes, going around the circle counter-clockwise:

major scale fingering	mode	location in parent major scale	altered tones of key scale
3	Locrian	step 7 of Bb major scale	A major scale with b7, b3, b6, b2, b5
6	Phrygian	step 3 of F major scale	A major scale with b7, b3, b6, b2
2	Aeolian	step 6 of C major scale	A major scale with b7, b3, b6
5	Dorian	step 2 of G major scale	A major scale with b7, b3
1	Mixolydian	step 5 of D major scale	A major scale with b7
4	major (Ionian)	step 1 of A major scale	A major scale unaltered
7	Lydian	step 4 of A major scale	A major scale with #4

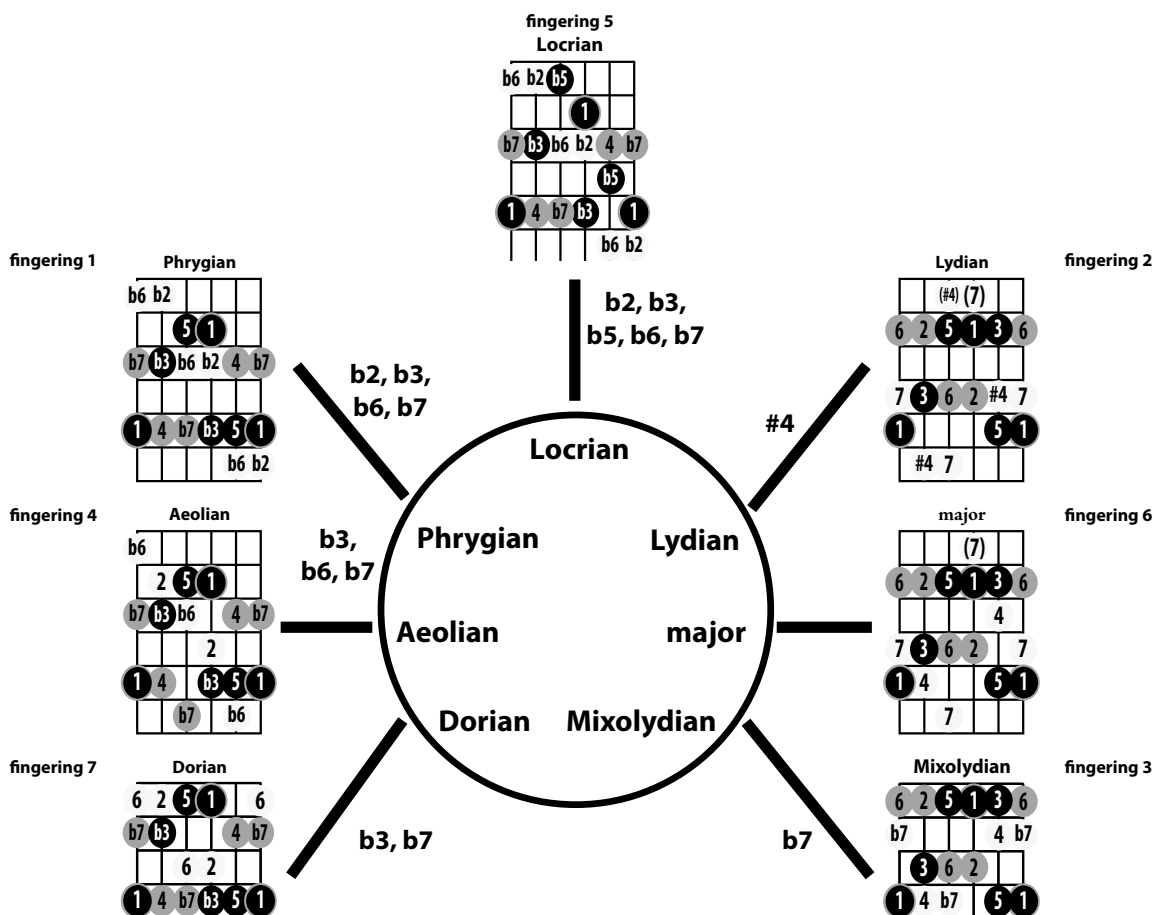

major scale modes, fingering 5-1

To play the modes above all in the key of “A”, play them with the “1” on the fifth string on the note “A”, fretted with the little finger (4). The “A” note would be at the fifth string, twelfth fret. That would produce the following darkening cycle of major scale modes, going around the circle counter-clockwise:

major scale fingering	mode	location in parent major scale	altered tones of key scale
4	Locrian	step 7 of Bb major scale	A major scale with b7, b3, b6, b2, b5
7	Phrygian	step 3 of F major scale	A major scale with b7, b3, b6, b2
3	Aeolian	step 6 of C major scale	A major scale with b7, b3, b6
6	Dorian	step 2 of G major scale	A major scale with b7, b3
2	Mixolydian	step 5 of D major scale	A major scale with b7
5	major (Ionian)	step 1 of A major scale	A major scale unaltered
1	Lydian	step 4 of A major scale	A major scale with #4

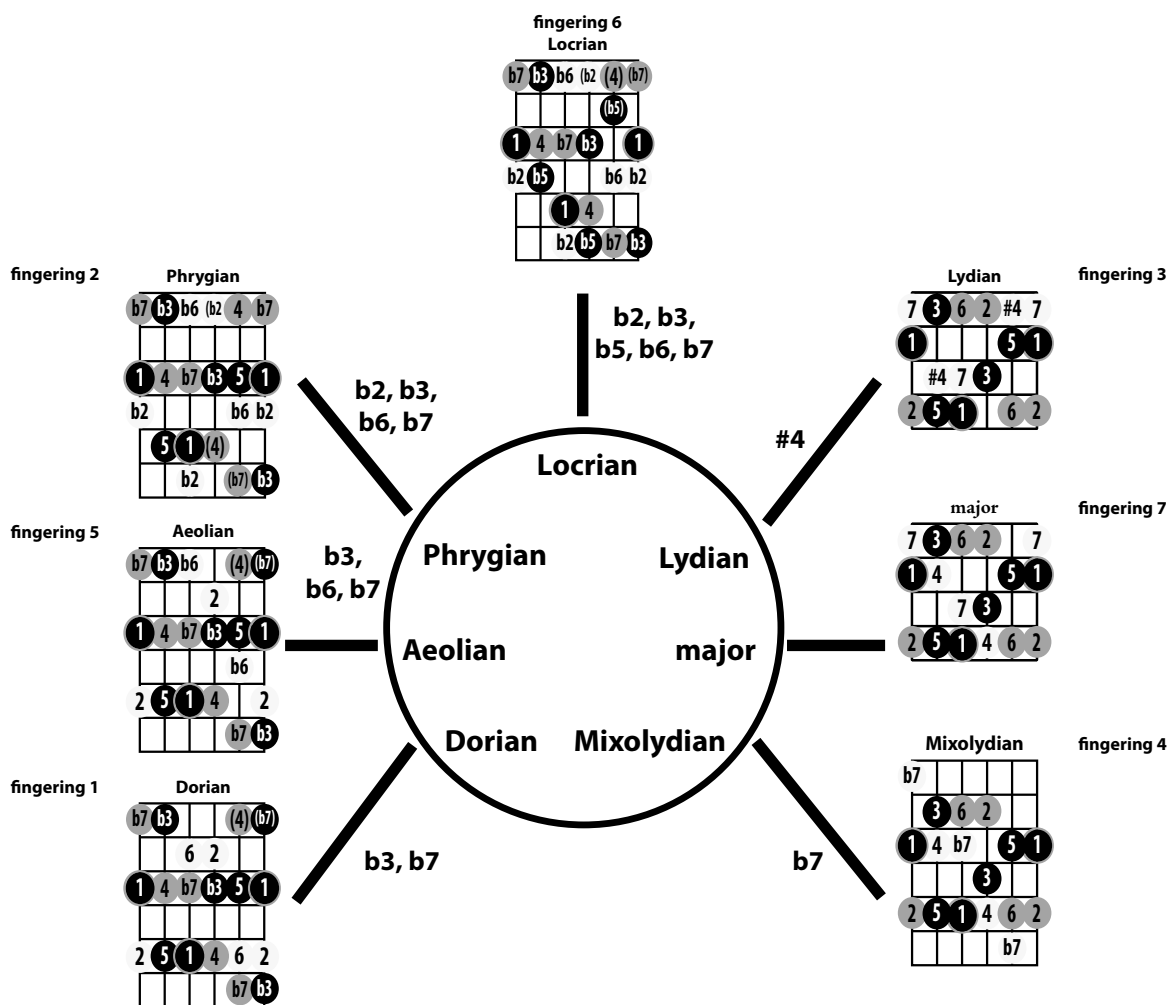

major scale modes, fingering 6-4

To play the modes above all in the key of “A”, play them with the “1” on the sixth string on the note “A”, fretted with the little finger (4). The “A” note would be at the sixth string, fifth fret. That would produce the following darkening cycle of major scale modes, going around the circle counter-clockwise:

major scale fingering	mode	location in parent major scale	altered tones of key scale
5	Locrian	step 7 of Bb major scale	A major scale with b7, b3, b6, b2, b5
1	Phrygian	step 3 of F major scale	A major scale with b7, b3, b6, b2
4	Aeolian	step 6 of C major scale	A major scale with b7, b3, b6
7	Dorian	step 2 of G major scale	A major scale with b7, b3
3	Mixolydian	step 5 of D major scale	A major scale with b7
6	major (Ionian)	step 1 of A major scale	A major scale unaltered
7	Lydian	step 4 of A major scale	A major scale with #4

major scale modes, fingering 6-2

To play the modes above all in the key of “A”, play them with the “1” on the sixth string on the note “A”, fretted with the middle finger (2). The “A” note would be at the sixth string, fifth fret. That would produce the following darkening cycle of major scale modes, going around the circle counter-clockwise:

major scale fingering	mode	location in parent major scale	altered tones of key scale
6	Locrian	step 7 of Bb major scale	A major scale with b7, b3, b6, b2, b5
2	Phrygian	step 3 of F major scale	A major scale with b7, b3, b6, b2
5	Aeolian	step 6 of C major scale	A major scale with b7, b3, b6
1	Dorian	step 2 of G major scale	A major scale with b7, b3
4	Mixolydian	step 5 of D major scale	A major scale with b7
7	major (Ionian)	step 1 of A major scale	A major scale unaltered
3	Lydian	step 4 of A major scale	A major scale with #4

coordinating the major scale fingering cycle with the mood cycle

To coordinate the major scale fingering cycle with the mood cycle, you need a point of reference. Choose the mode and the fingering you wish to use, following the instructions above. Once you determine the mode and fingering you will use, both of them will follow the 7-3-6-2-5-1-4 cycle (Locrian-Phrygian-Aeolian-Dorian-Mixolydian-major-Lydian, respectively).

This paragraph just discusses the modes, not the fingerings. The modes will brighten in the 7-3-6-2-5-1-4 order. The 7-3-6-2-5-1-4 cycle repeats (hence the name “cycle”). If you begin on mode 2, for example, the order of darkening modes would be 2-5-1-4 to the end of the 7-3-6-2-5-1-4 series, then would continue with 7-3-6 the beginning of the cycle. This would make the series of brightening modes 2-5-1-4, then at 7, it would jump to a dark mode (7 is Locrian), then continue brightening through modes 7-3-6 (Locrian-Aeolian-Dorian). Think of the 7-3-6-2-5-1-4 series as a cycle, where you can start at any point, but whenever you get to “4”, it is the brightest mode. Continuing after “4”, “7” would begin again with the darkest mode, Locrian.

If you now understand the brightening order of modes as described in the paragraph above, the order of fingerings will use the same 7-3-6-2-5-1-4 series. The mode series and the respective fingerings on a particular notes are only parallel when the tone center is on the sixth string, fretted with the index finger. Otherwise the cycle of brightening moods and the cycle of major scale fingerings use the same number cycle in an offset manner. You can see this coordinated order in the table below and in the cycle diagrams of fingerings on the previous pages.

table of respective major scale fingerings for the brightening cycle of modes

fingering for the low-octave tone center (string-finger)	major scale fingering series
6-1	7-3-6-2-5-1-4 respectively for modes 7-3-6-2-5-1-4
4-1	1-4-7-3-6-2-5 respectively for modes 7-3-6-2-5-1-4
5-4	2-5-1-4-7-3-6 respectively for modes 7-3-6-2-5-1-4
5-2	3-6-2-5-1-4-7 respectively for modes 7-3-6-2-5-1-4
5-2	4-7-3-6-2-5-1 respectively for modes 7-3-6-2-5-1-4
6-4	5-1-4-7-3-6-2 respectively for modes 7-3-6-2-5-1-4
6-2	6-2-5-1-4-7-3 respectively for modes 7-3-6-2-5-1-4

THE PREDOMINANCE OF MAJOR AND AEOLIAN

Since the beginning of the common practice period of European music in 1600, western music has predominantly used [the relative major and minor system](#). With the African-American influence in American music since 1900, Mixolydian and Dorian have come back into popularity. Mixolydian and Dorian were used off and on in the Middle East and Europe from around 500 BC until the common practice period. Mixolydian and Dorian were rarely used in the common practice period (1600 through 1900).

The predominance of major and Aeolian lingers. We still tend to imagine melodies in the key of the II minor chord of a major scale or in the key of the III minor chord of a major scale in Aeolian (the natural minor scale built on the sixth step of the major scale).

If you want to establish the Dorian mode as a key on the II minor chord of a major scale or to establish the Phrygian mode as a key on the III minor chord of a major scale, you have to go out of your way to make it really sound like that mode. Otherwise, our memories of thousands of songs in Aeolian mode will influence us to imagine the music in Aeolian mode.

The same is true of Lydian mode. If you don't go out of your way to establish Lydian as the mode, memories of thousands of songs in major mode (Ionian) will influence us to imagine the music in major mode.

As stated above, Mixolydian has been established by the African-American influence in American music and it can easily be established in blues, rock and jazz styles. Similarly, Dorian can be easily established in those genres as a minor key version to contrast a major key.

MODAL INTERCHANGE (CHANGE OF MODE)

Change of Mode on the Same Tone Center

Changing the mode on the same tone center is a direct manner of changing the mood. This is discussed in the next section “[The Expressive Use of Modes](#)”. Mode change on the same tone center can be conceived with all the modes of the four harmonizable seven-tone (heptatonic) scales (major, harmonic minor, melodic minor and harmonic major), as shown in the last section of this chapter “[Mode Families](#)”.

The tables shown in [Substitution](#)/Alternate Qualities of Large Arpeggios are repeated at the bottom of this section, since they are an effective overview of modal interchange on the same tone center.

Change of Mode with Changing Tone Centers

Changing the mode with different tone centers can use the “[The Expressive Use of Modes](#)” (in the next section) by changing which tone of a seven tone scale is the tone center and/or by changing to modes of another seven-tone (heptatonic) scale.

Subtitution and Ambiguity

The chapter “[Substitution](#)” shows many alternate chords, which can be used in a composition, rather than just in improvisation. Most of the substitutes discussed involve changing the tone center, but “Darkening” and Alternate Qualities of Large Arpeggios” imply changes of mode on the same tone center. The tables shown in [Substitution](#)/Alternate Qualities of Large Arpeggios are repeated at the bottom of this section, since they are an effective overview of modal interchange on the same tone center.

The chapter “Scale Ambiguity” shows modal interchange categorically by chord type.

Triad Modal Interchange

See the section “[Composing Triad Progression with Change of Mode](#)”, later in this chapter.

Summary of Chord Progression Types

The chapter “[Summary of Chord Progression Types with Improv](#)” shows most of the types of chord progression in use. Most of those progressions imply changes of mode.

Mixolydian through Locrian modes accumulate the flatted numbers 73625.

Altering the Major Scale To Make Modes Of Other Seven Tone Scales

Major #5 variations: major #5, Dorian #4, Phrygian major third, Lydian #2, Mixolydian “#1”, Aeolian natural 7 (harmonic minor), Lydian #6.

Melodic minor variations: major b3, Dorian b2, Phrygian “b1”, Lydian b7, Aeolian dominant (also called Aeolian major or Mixolydian b6), Aeolian b5, super Locrian (Locrian b4).

The Expressive Series of Major Scale Modes by Alteration

Moving to the right in the expressive series of substitute modes tends to produce brighter, happier moods. Moving left in the expressive series tends to produce darker, sadder moods. The expressive series may be used melodically or harmonically. Melodic applications (in soloing or composition) involve movement to the right or left in changing the mode to more closely resemble the notes in the accompanying chords (accommodating chords). When melodically substituting for expressive purposes, the expressive series is more often used in “darkening” the mood by moving to the left, adding flats to the mode formula (except in changing from Lydian to major, which removes a sharp). Occasionally, movement to the right in the expressive series is used by melodically substituting Lydian mode for major or Dorian mode for Aeolian.

Other movement to the right (brightening moods) is rare in melodic mode substitution.

Harmonic Applications

The chord progression or other form of accompaniment part may involve movement in both directions in the series, darkening or brightening the mood.

Melodic Use of the Expressive Series

accommodating chords.

When the mode you're using now needs to accommodate more flats because of the upcoming chord(s) in the progression, move to the left in the expressive series from the present mode until you arrive at one which has the flats (in the scale formula) you need. When the present mode needs to accommodate more sharps (according to the upcoming chords), move to the right in the expressive series from the present mode until you get to one with the sharps (in the scale formula) you need.

Accommodating chords is not substituting modes, and is therefore not using the expressive series to alter the mood.

Substituting Modes For Expressive Purposes.

Bluesy substitutes. "Blues" is a feeling of melancholy, depression and despondency. Substituting to the left in the expressive series from major to Mixolydian or Dorian, or from Mixolydian to Dorian produces a bluesy mood or sound. If the present mode is major, you may substitute Mixolydian for a bluesy sound or Dorian for a very bluesy sound. If the present mode is Mixolydian, you may substitute Dorian for a more bluesy sound.

Harmonic Use of the Expressive Series

The expressive series of substitute modes can be used with chord progressions (or other forms of accompaniment parts) and may involve movement in both directions in the series, darkening or brightening the mood.

use of the expressive series in composing and arranging.

Composed and arranged accompaniment parts can be more intricate, while comping (improvising) and accompaniment part is more dependent on the musical expression of the other players. Temporary change of mode while using the same tone center may occur for as brief a time as a single beat or for an entire section of a song.

"comping" with the expressive series

In many situations, the accompanists have freedom of expression through changing modes also. They can alter part of the background to contrast against the rest of the band. One section can alter the arrangement by changing mode while the rest of the band remains in the mode originally intended.

Blues in C Darkened with Blue Notes

12 bar blues in C with chord scales, parent scales, key scales and blue scales

chords	C7 (I7)	C7 (I7)	C7 (I7)	C7 (I7)
chord scales	C Mixolydian (C major with b7)			
parent scales	F major			
key scales	C Mixolydian (same as chord scale)			
blue scales	C Dorian (flattening the third in addition to the seventh) with Bb major parent scale			
chords	F7 (IV7)	F7 (IV7)	C7 (I7)	C7 (I7)
chord scales	F Mixolydian		C Mixolydian	
parent scales	Bb major			
key scales	C Dorian (C major with b3, b7)			
blue scales	none		C Dorian with Bb parent scale	
chords	G7 (V7)	F7 (IV7)	C7 (I7)	G7 (V7)
chord scales	G Mixolydian	F Mixolydian	C Mixolydian	G Mixolydian
parent scales	C major	Bb major	F major	C major
key scales	C major (same as parent scale)	C Dorian (b3, b7)	C Mixolydian (b7)	C major
blue scales	C Mixolydian (same as F major parent)	none	C Dorian (same as Bb major parent)	C Mixolydian (same as F major parent)
very blue scale	C Dorian (same as Bb major parent)			C Dorian (same as Bb major parent)

darkening the I7 chord

Flat the third, changing C Mixolydian (with its C major 6/9 pentatonic subset) to C Dorian (with its Cm6/9 pentatonic subset and its Cm7/11 pentatonic subset). This makes the scale (or scales, including the pentatonic subsets) the same for I7 and IV7. Compared to a major scale, Dorian has flat three and flat seven.

If you also use the “very blue” option for the V7 chord, C Dorian (I Dorian), the scales are the same for the I, IV and V chords. This sets up the common situation of being able to play the Im7/11 pentatonic (Cm7/11 pentatonic) on all three of the chords (I7, IV7, and V7 or C7, F7, G7).

darkening the IV7 chord

Don't go there. If you were to flat the third of the IV chord by using a minor pentatonic chord scale (F minor pentatonic) or the F Dorian scale of which it is a subset, the key scale name of those same notes is C Aeolian, which has a flatted sixth. Flat six is associated with minor key jazz, middle eastern and Spanish music and draws too far away from what is usually thought of as major key blues (I IV V).

darkening the V7 chord

Flatting the seventh of the key and using I Mixolydian (C Mixolydian, with F major parent) darkens the V chord by making it sound minor. The chord scale name for the same notes is V Dorian (G Dorian, with F major parent). Compared to a major scale, Mixolydian has flat seven.

To darken even more, flat both the third and the seventh of the key with I Dorian (C Dorian, with Bb major parent) making the V chord sound minor and providing a note to make V augmented or V7#5. The chord scale name for the same notes is V Aeolian (G Aeolian, with Bb major parent).

THE VAGUENESS OF KEY SIGNATURES

The Major-Minor Key Signature System

The purpose of key signatures should be to show the set of notes that are used in a piece of music, especially when the piece uses only or predominantly seven different notes (two or more of the same note repeating in octaves would count as one note in this case).

As of the writing of *The Well-Tempered Clavier* by Johann Sebastian Bach in 1722, pieces of music would conform to the two tone center options in twelve keys (making 24 keys: twelve major and twelve minor). See [the key signature table](#). That worked for almost 200 years, until blues, jazz and other twentieth century music came along. In the twentieth century the other modes came back into use, especially Mixolydian to darken the major scale by flattening the seventh and Dorian mode to further darken the major scale by flattening both the third and the seventh. Bach wrote in six of the seven modes, as far as we know, excluding Locrian mode. He probably experimented with Locrian mode, being a thorough researcher.

Mixolydian

Mixolydian mode can be created by flattening the seventh of a major scale changes the numbered tones of the major scale to 1-2-3-4-5-6-b7-1. C major with flat seven has the letters C-D-E-F-G-A-Bb-C. Another way to conceive Mixolydian mode is using another major scale where the desired Mixolydian tone center is on the fifth of it. See [G Mixolydian](#). Using the [F major scale](#) (the major scale built of the fourth step of C major with the letters F-G-A-Bb-C-D-E-F) with the tone center on its fifth step also produces C Mixolydian with the letters C-D-E-F-G-A-Bb-C.

You can use either rule. Play a major scale and flat its seventh step or find the major scale where the desired tone center is on its fifth step.

Dorian

Flattening both the third and the seventh of a major scale changes the numbered tones of the major scale to 1-2-b3-4-5-6-b7-1. C major with flat three and flat seven has the letters C-D-Eb-F-G-A-Bb-C. Also conceive Dorian is by using another major scale where the desired Dorian tone center is on the second step of it. Using the [Bb major scale](#) (the major scale built of the flattened seventh step of C major with the letters Bb-C-D-Eb-F-G-A-Bb) with the tone center on its second step also produces C Dorian with the letters C-D-Eb-F-G-A-Bb-C.

Play a major scale and flat its third and seventh steps or find the major scale (on the flattened seventh of the major scale in the key you want to be Dorian) where the desired tone center is on its second step.

The Problem with the Key Signature System for Modes

the is no common specification for major or minor

Even if the key were to be on the traditional (1600-1900) first or sixth steps of the major scale, there is no common convention to tell the reader which one. Modern music doesn't necessarily end on the tone center, so you can't rely on judging by the final chord in a piece of music. It should specify in words above the key signature, "C" major or "A" Aeolian (or "F" major or "D" Aeolian for the F major scale, etc.). Wouldn't that be nice?

modal key signatures

In the same manner that verbal languages that are still in common use are constantly evolving with new words, new rules for sentence structure, etc., music notation should be more of a living language, including modern options for key signatures.

A modal key signature specifies the mode. See the examples below where the mode, such as "D" Dorian or "E" Phrygian is shown above the key signature.

the major modes are notated indiscriminately

The major-minor key signature system is commonly used to indicate the major modes major (Ionian mode), *Lydian mode* or *Mixolydian mode* by using the major key signature indiscriminately. The notes that are altered, such as Lydian mode having a sharped fourth compared to major in the same key or Mixolydian having a flatted seventh in the same key are only visible in the body of the music, where you will see certain notes flatted, sharped or made natural to raise or lower them as needed for the mode.

F Lydian is commonly shown with the F major key signature, rather than the smarter option of using the key signature for its parent scale, C major, with a specification above the key signature that the "F" note will be the tone center, using the text "F" Lydian or "F" Lydian mode.

the common practice key signature for F Lydian

The musical notation shows a 4-measure phrase in 4/4 time with a key signature of one sharp (F#). The notes are F4, A4, C5, E5, F#4, A4, C5, E5, F#4, A4, C5, E5, F#4, A4, C5, E5. Above the staff, the following chord symbols are written: F6add#11, G/B, C(add9), C6, F6add#11, and Fmaj9. Below the staff is a fretboard diagram for a guitar with 12 frets, showing the fret numbers for the notes: F (1), A (2), C (3), E (4), F# (5), A (6), C (7), E (8), F# (9), A (10), C (11), E (12).

A 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

B

the minor modes are notated indiscriminately

The major-minor key signature system is commonly used to indicate the minor modes [Aeolian mode](#), [Dorian mode](#) or [Phrygian mode](#) or by using the major key signature indiscriminately. The notes that are altered, such as Dorian mode having a flattened third and seventh compared to major in the same key are only visible in the body of the music, where you will see certain notes flattened or made natural to lower them.

D Dorian is commonly shown with the F major key signature (implying its relative minor D Aeolian), rather than the smarter option of using the key signature for its parent scale, C major, with a specification above the key signature that the "D" note will be the tone center, using the text "D" Dorian or "D" Dorian mode.

the common practice key signature for D Dorian

Common practice key signature for D Dorian (B-flat major). The notation shows a melody in 4/4 time with chords Dm7, G7, F, C, Dm7, G7, F, C, and a final Dm7-C-Dm7. The guitar tablature below shows the fretting for each measure.

the smarter modal key signature for D Dorian

Smarter modal key signature for D Dorian (D major). The notation shows a melody in 4/4 time with chords Dm7, G7, F, C, Dm7, G7, F, C, and a final Dm7-C-Dm7. The guitar tablature below shows the fretting for each measure.

E Phrygian is rare, but using the common practice key signatures, it would be shown with the G major key signature (implying its relative minor E Aeolian), rather than the smarter option of using the key signature for its parent scale, C major, with a specification above the key signature that the “E” note will be the tone center, using the text “E” Phrygian or “E” Phrygian mode.

the common practice key signature for E Phrygian

Common practice key signature for E Phrygian (G major). The notation shows a melody in 3/4 time with chords Em, Am, Dm7, G, F, and Em. The guitar tablature below shows the fretting for each measure.

the smarter modal key signature for E Phrygian

Smarter modal key signature for E Phrygian (C major). The notation shows a melody in 3/4 time with chords Em, Am, Dm7, G, F, and Em. The guitar tablature below shows the fretting for each measure.

if there were a piece in Locrian mode, it would also be notated indiscriminately

B Locrian is very rare. Using common practice key signatures, it would be shown with the D major key signature (implying its relative minor B Aeolian), rather than the smarter option of using the key signature for its parent scale, C major, with a specification above the key signature that the “B” note will be the tone center, using the text “B” Locrian or “B” Locrian mode.

the common practice key signature for B Locrian

Common practice key signature for B Locrian (D major). The notation shows a treble clef with a key signature of two sharps (F# and C#). The melody is written in 4/4 time. Chords indicated above the staff are B° (B diminished), F (F major), Em (E minor), Dm (D minor), and B° (B diminished). The bass line is written on a grand staff (T, A, B) with fingerings: 0 1 0, 0 1, 0 1 3 0 1 2 0 1, 0 0 1 0 0 2, 0.

the smarter modal key signature for B Locrian

Smarter modal key signature for B Locrian (C major). The notation shows a treble clef with a key signature of no sharps or flats. The melody is written in 4/4 time. Chords indicated above the staff are B° (B diminished), F (F major), Em (E minor), Dm (D minor), and B° (B diminished). The bass line is written on a grand staff (T, A, B) with fingerings: 0 1 0, 0 1, 0 1 3 0 1 2 0 1, 0 0 1 0 0 2, 0.

Atonal Key Signatures

When a piece of music defies the sense of key and it is not clear which chord and tone center you expect it to end on, the word *atonal* can appear above the key signature, indicating that the piece is *not tonal*. The melodic example below uses Schoenberg's twelve tone row followed by retrograde inversion.

an atonal key signature - [click to play video](#)

Swing Eighths

atonal

Atonal key signature example (Schoenberg's twelve tone row). The notation shows a treble clef with a key signature of no sharps or flats. The melody is written in 4/4 time. The bass line is written on a grand staff (T, A, B) with fingerings: 3 2 0 4, 3 2 2 1 1 3, 1 1 2 2 3 4, 0 2 3, 3.

CHORDS AND MODES BY NUMBERED TYPE

What's a V Type Chord?

A V type chord is one that uses the notes in itself, and in the music played during it from a seven-tone scale where the root of the chord is on the fifth step. A major chord may be a I type, IV type or V type, each using a different major scale. A minor chord may be a II type, a III type or a VI type, each using a different major scale.

In a blues in the key of C, the chords C7, F7 and G7 would be used. Each chord is a V type. C7 is on the fifth of an F major scale, F7 on the fifth of a Bb major scale and G7 on the fifth of a C major scale. Yet, you need to also be able to think in the key of "C", so you need to translate the numbered tones each one of those major scales where "C" is "1", which will cause flatted seven or flatted seven and flatted three. See Modes [On I IV V Blues](#).

Why Use a IV Chord as a "V Type"

If a song is in the key of C major and we're on "F", the IV chord, the parent scale would be C major. To change the mood, change the "F" chord quality or setup a chord progression, we can change the scale during the F chord. With the original C major scale, Fma7 has happiness (the F major triad on the root) and sadness (the A minor triad on the third). To darken the F chord, we could use the Bb major scale, making the F as a V type with a darker mood. The V type has components of happiness (the F major triad on the root of F7), depression (the A diminished triad on the third of F7) and the angry tritone (the interval made with the A and Eb notes of F7).

F	Am	Fmaj7	F	F dim	F tritone	F7
major is happy	minor is sad	adds the happy F major and the sad Am minor to make the romantic happy/sad composite, Fmaj7	major is happy	diminished is very sad	tritone is angry	combines happy, very sad and angry to make the complex dominant seventh
T A B	5 7 8	5 5 8	5 5 8	4 5 7	5 7	4 5 8

Making a IV chord a V type is typical of blues and of bluesy jazz. Bluesy jazz songs with IV7 (where the IV chord is a V7 type) include Willow Weep for Me, Sonnymoon for Two, Tenor Madness, All Blues, One For My Baby or There Is No Greater Love.

Determining the Numbered Type for a Chord

In accompaniment and melody both, the notes used during a particular chord are generally taken from a particular heptatonic (seven-tone) scale, like major (most common) or harmonic minor. The seven-tone scale is chosen to produce a particular mood and genre. Making a I or IV chord a V type makes it darker and bluesy. Making a II or II chord a VI type makes it sound like the traditional minor key built on the sixth step of major scales.

If you are analyzing a piece of music as to the numbered types of chords, determine the seven-tone scale used for each chord. Then number the type after the numbered tone that the chord root in question occurs on. If you are in the key of C and an “F” major scale is being used during the Dm chord, you would determine that “D” is on the sixth step of F major and therefore the Dm chord is a VI type.

Changing Key Scale Types

It is very common in contemporary music that the key scale type changes. In a three-chord major blues, each chord is used as a “V type”, meaning each uses a scale where the chords root is on the fifth step of some major scale. To think in the overall key, you need to re-number each major scale with the one note that is the name of the key.

	type	chord scale	chord elaboration	key scale	parent scale	mood/genre
F	I type	F major	Fma7, Fma9	C Mixolydian	F major	blues, folk
G	II type	G Dorian	Gm7, Gm9	C Mixolydian	F major	darkening, blues
C7	V type	C Mixolydian	C7, C9, C13	C Mixolydian	F major	darkening, blues
F7	V type	F Mixolydian	F7, F9, F13	C Dorian	Bb major	darkening, blues
Dm	VI type	D Aeolian	Dm7, Dm9	C Mixolydian	F major	traditional minor
Dm	harmonic minor	D har. minor	Dm(ma7), Dm9(ma7)	C Mixolydian	F major	traditional minor

Modes by Numbered Type

Each major scale mode is built on a particular numbered tone of a major scale. To think major scale modes by numbered type, use the number of the scale step on which the mode was built. Why not use the mode name? You can, but using the number may allow you to think faster.

With modes of harmonic minor and melodic minor, specific names are better.

C major scale modes

C	Ionian	I type
D	Dorian	II type
E	Phrygian	III type
F	Lydian	IV type
G	Mixolydian	V type
A	Aeolian	VI type
B	Locrian	VII type

A harmonic minor

C	major sharp five
D	Dorian sharp two
E	Phrygian major
F	Lydian sharp two
G#	G Mixolydian sharp one
A	harmonic minor
B	Locrian

C melodic minor

C	melodic minor (major b3)
D	Dorian flat two
E \flat	E Phrygian flat one
F	Lydian dominant (b7)
G	Mixolydian flat six
A	Aeolian flat five
B	Super Locrian (b4)

COMPOSING TRIAD PROGRESSION WITH CHANGING MODE

Notes That Change the Key Signature

Use consecutive chords that display the change in key signature when a chromatic voice is effective. Otherwise, disguise it by using avoiding use of the tone that is being altered chromatically (that is being changed chromatically with an accidental, but retaining the same letter or number).

Featuring a Chromatic Key Signature Change

For example, the A Dorian mode has F# as 6. In changing to A Aeolian, the F# which is 6 changes to F, which is b6. In *While My Guitar Gently Weeps*, this changing note is used to cause a chromatic bass part: note the chromatic sequence on the sixth string below (Am/G-D/F#-F). The D chord is in A Dorian with “6” while the F chord is A Aeolian with “b6”.

Disguising a Key Signature Change

Changes of key signatures occur with a change of the major scale. Key signature changes are often disguised, where the melody doesn't use the particular notes that change with the key signatures. Commonly, the change of key signature involves a chord brightening or darkening the mood.

brightening the mood

Brightening the mood can be accomplished by changing a minor chord in one key (Dm as IIm of the C major scale) to the major version of the same chord in another key signature (D major as V major of the G major scale).

example 1-Dm changed to D major

♩ = 100

C major scale

example 1 with C major scale-tone Dm changed to G major scale-tone D major

C major scale G major scale C major scale C major scale

darkening the mood

Changing a major chord in one key (F major as IV major of the C major scale) to the minor version of the same scale (Fm as a IIIm of Eb major) will darken the mood. Usually, the scale is chosen that changes the key signature the least.

To disguise the key signature change, don't use consecutive chords that have roots with chromatically different versions of the same letter. For example, Bb major as IV of F major to Bm as IIIIm of G major would be conspicuous. Bb major as IV of F (with the note "Bb") progressing to G major as I of G (with the note "B") would be less conspicuous, if the chords had the roots "Bb" and "G" respectively in the bass.

[click to play](#)

♩ = 90

C major scale C major scale Eb major scale C major scale

The “D-A-C-G” example below does not *conceal* the key signature change from D major to G major, with the “C#” note in the A chord and the “C” note in the C chord. Instead, it *features* the chromatic series “D-C#-C-B” on the second string. “D” and “A” are the I and V chords of D major, while “C” and “G” are the Iv and I chords of major.

The “D-A-Bm-C” example below makes it less obvious that the “C#” note in the A chord has changed to the “C” note in the C chord, since the A and C chords are not consecutive.

Triad chord progressions up or down stepwise do not include a chromatic key signature change. In the following stepwise sequence of C, G and D major scale-tone chords, changes are disguised. F-Em are IV-III^m of C major scale, D-C are V-IV of G major scale and Bm-A are VI-V of D major scale.

track the numbered tone in triad construction

Each letter that you’re trying to feature or avoid occurs in three triads. If you are aware of the parent scale number of the note you are feature or avoiding, you can determine which chords it is “3”, for example, that would be in the I triad (1-3-5), the III^m triad (3-5-7) and the VI^m triad (6-1-3).

ESTABLISHING A MINOR KEY

Most commonly, a minor key is established on the sixth step of a major scale, making Aeolian mode. A common alternative to the Aeolian mode is harmonic minor scale.

The Parent Major Scale for Aeolian

To determine the parent major scale for any key of Aeolian mode, answer the question, where “X” is the name of the Aeolian key: “if X is six, what is one?” The letter name of the parent major scale would be two letter higher in the musical alphabet and would an interval of one and a half steps (three frets) higher. The table below shows the note names in all major scales. Testing the formula above: “if A Aeolian is six (see in the “6” column, below), what is one?” As you can see, the answer would be C major scale.

table of modes of all major scales

scale tone →	1	2	3	4	5	6	7
mode →	major scale	Dorian mode	Phrygian mode	Lydian mode	Mixolydian mode	Aeolian mode	Locrian mode
parent scale ↓							
C major	C Ionian mode	D Dorian mode	E Phrygian	F Lydian mode	G Mixolydian mode	A Aeolian mode	B Locrian mode
F major (one flat)	F Ionian mode	G Dorian mode	A Phrygian mode	Bb Lydian mode	C Mixolydian mode	D Aeolian mode	E Locrian mode
Bb major (two flats)	Bb Ionian mode	C Dorian mode	D Phrygian mode	Eb Lydian mode	F Mixolydian mode	G Aeolian mode	A Locrian mode
Eb major (three flats)	Eb Ionian mode	F Dorian mode	G Phrygian mode	Ab Lydian mode	Bb Mixolydian mode	C Aeolian mode	D Locrian mode
Ab major (four flats)	Ab Ionian mode	Bb Dorian mode	C Phrygian mode	Db Lydian mode	Eb Mixolydian mode	F Aeolian mode	G Locrian mode
Db major (five flats)	Db Ionian mode	Eb Dorian mode	F Phrygian mode	Gb Lydian mode	Ab Mixo. mode	Bb Aeolian mode	C Locrian mode
Gb major (six flats)	Gb Ionian mode	Ab Dorian mode	Bb Phrygian mode	Cb Lydian mode	Db Mixolydian mode	Eb Aeolian mode	F Locrian mode
G major (one sharp)	G Ionian mode	A Dorian mode	Bb Phrygian mode	C Lydian mode	D Mixolydian mode	E Aeolian mode	F# Locrian mode
D major (two sharps)	D Ionian mode	E Dorian mode	F# Phrygian mode	G Lydian mode	A Mixolydian mode	B Aeolian mode	C# Locrian mode
A major (three sharps)	A Ionian mode	B Dorian mode	C# Phrygian mode	D Lydian mode	E Mixolydian mode	F# Aeolian mode	G# Locrian mode

F# major (six sharps)	F# Ionian mode	G# Dorian mode	A# Phrygian mode	B Lydian mode	C# Mixolydian mode	D# Aeolian mode	E# Locrian mode

For a more detailed version of this table with triads, sevenths and pentatonic scales, see [The Modes of All Major Scales](#), earlier in this chapter.

The Minor Key (Cm) V Chord (G)

Since Aeolian is built on major scale tone six, the parent major scale for C Aeolian would be Eb major. The V chord in the key of C Aeolian is G minor, IIIIm of the parent Eb major scale. To strengthen the progression (cadence) from Gm to Cm (Vm of Cm to Im of Cm), the Vm (Gm) can be changed to G major. This makes G a secondary dominant. See “[Secondary Dominant](#)”. Changing Gm7 of the

Eb parent scale to G7 is also a secondary dominant. Adding a harmony to G7, making G7b9 is also a secondary dominant.

As a four-note chord, the Vm7 (Gm7) is commonly changed to V7 (G7). In changing the parent Eb major scale to accommodate the V (G) or V7 (G7) chord, the parent Eb major scale would have sharp five. This creates Eb major sharp five (the sharpened fifth is B natural) with C harmonic minor on its sixth step and G Phrygian dominant on its third step.

Pentatonic Scale Exercises In a Minor Key

c minor pentatonic in sixteenths [click to play](#)

The image displays two systems of musical notation for C minor pentatonic scale exercises in sixteenths. The first system includes 'Swing Sixteenths' (♩ = 95) and 'Straight Sixteenths' (♩ = 95) for Cm7 and Abmaj7, each played 3 times. The second system includes 'Swing Sixteenths' (♩ = 95) and 'Straight Sixteenths' (♩ = 95) for Fm7, Cm, Bb, Ab, G, and Cm, with the last four chords played 4 times each. The notation includes treble and bass staves with fingerings (8, 10, 11) and a 'play 3 times' or 'play 4 times' instruction.

the Aeolian key minor triad (Cm) is part of IVm9 (Fm9)

emphasize 4, 5 and b7 of the Aeolian key minor pentatonic to sound parts of V7 and V7b9

the Aeolian Im7 (Cm7) is part of IVm11 (Fm11) and bVIIma9 (Abma9)

the Aeolian key minor 9 (Cm9) is part of IIIm13 (Fm13) and bVIIma9#11 (Abma9#11)

Six-Tone Scales

Use G minor pentatonic with natural three, add b2 to emphasize G major triad tones on the beat.

C Aeolian and C Harmonic Minor Scale and Arpeggio Exercises

Eb major scale
fingering 6 VII

Eb major sharp five
fingering 6 VII

The Eb major and Eb major sharp five scale fingerings above alternate notes with black and gray background to create thirds with which to build chords. Playing a major scale or other seven-tone scale in an every-other-note pattern creates thirds, since each note to the next is three scale tones, inclusively

Learn to think and play all major scale fingerings in such a structure, called *full tertian* scales. “Tertian” means “made of thirds”. All the triads, sevenths, ninth, eleventh and thirteenth arpeggios are embodied in tertian fingerings. See [“Scale-Tone Arpeggios and Pentatonics”/Major Scale-Tone Full-Tertian Arpeggios](#) and [“Prime Scales, Chords and Arpeggios”/Seven-Tone Scales In Seven Areas with Tertian Fingerings In Black and Gray](#).

The mode on III of Eb major sharp five is III (G) Phrygian dominant. Important subsets of (G) Phrygian dominant are:

1. G minor pentatonic with a natural third
2. G minor pentatonic with natural three, add b2
3. G7 arpeggio
4. G7b9 arpeggio
5. Bdim7=Ddim7=Fdim7=Abdim7 (synonyms)=G7b9 no root.

The three unique diminished sevenths for all twelve keys are spelled: ACEbF#, BDFG#(Ab) and EGBbC#.

Octatonic Scales

C Aeolian add natural seven to emphasize Cm7 tones on the beat. G Phrygian dominant add natural seven to emphasize G7 tones on the beat.

MODES ON I IV V BLUES

Predicting the Melody

The listener predicts the melody along with the composer or improviser, in that one should mainly compose or improvise what the listener expects. In doing that, the listener expects melodies to be based on a key, with various versions of scales named after the key.

To accommodate the various chords and moods that occur during a chord progression, a melody, commonly uses multiple scales. Every scale usually has the overall tone center (the tonic) in it.

The Common Twelve-Bar, I IV V Blues Chord Progression

C7 (I7)	C7 (I7)	C7 (I7)	C7 (I7)
F7 (IV7)	F7 (IV7)	C7 (I7)	C7 (I7)
G7 (V7)	F7 (IV7)	C7 (I7)	G7 (V7)

Key Scale, Chord Scale and Parent Scale in Blues

key scale blues

As music repertoire demonstrates overwhelmingly, key scales predominate over chord scales. Although it is important for the melody to harmonize with each chord in the accompaniment, it is more important to somehow simultaneously make consistent reference chords and scales named after the key. This aurally provides a focal point and harmonies of it for the listener. If the song is in the key of “C”, listeners have been trained to expect the focal point to be on the note “C” and to expect various types “C” chords and “C” scales to support it. The “C” chords may be part of other chords, such as C minor (C-Eb-G) being part of F9 (F-A-C-Eb-G).

blues darkens the I chord with flat seven of the key

The seventh chord built on the first step of a major scale is major seventh. Blues usually uses a I dominant seventh chord (I7, C7 in the key of C). The I7 has a flatted seventh, compared to a major scale. Major scale with flatted seventh makes Mixolydian mode. C major scale with flat seven is C Mixolydian.

blues darkens the IV chord with flat three of the key

Blues usually uses a IV7 version for its IV chord. IVma7 is 4-6-1-3 of the parent major scale (Fma7 is 4-6-1-3 of C major) and IV7 would be 4-6-1-b3 of the parent major scale (F7 is 4-6-1-b3 of C major, see All Scale-Tone Chords/Major Scale-Tone Chords). This is why IV7 (F7) uses a parent major scale

with a flat three. Since flattening only the third makes the melodic minor scale, not commonly used in blues, usually $b3$ and $b7$ are both used in blues, making a Dorian key scale. C major $b3$, $b7$ is C Dorian key scale, Bb major parent scale and F Mixolydian chord scale during an F7 chord in the key of C.

chord scale blues

The use of chord scales in building a melody can tend to segment the music, making melody in the key of each chord and segment the melody, losing the overall sense of key. However, it can be made to work, as has been done in surf instrumentals and blues instrumentals like Freddy King's Hideaway and Frank Virtue's Guitar Boogie Shuffle. To make chord melody work, it helps to use theme and variation, playing the same theme in the key of each chord to tie the chords together.

I-IV-V chord scale blues example with I ma pent, IV ma pent, V ma pent - [click to play video](#)

This blues improv example uses scales in the key of each chord. During each chord the melody makes sense to the ear, but it doesn't establish the overall sense of key like the key scale blues examples after it.

Swing Sixteenths
♩ = 95

The musical score is divided into three systems, each representing a different chord: C7, F7, and G7. Each system includes a treble clef staff with a key signature of one sharp (F#) and a 4/4 time signature. Below each staff is a guitar fretboard diagram with two lines, T (Treble) and B (Bass). The first system is for a C7 chord, the second for an F7 chord, and the third for a G7 chord. The melody is written in eighth and sixteenth notes, often beamed together. The fretboard diagrams show fingerings for each note, with some notes marked with a 1/4 note value. The piece ends with a double bar line.

Scale Tone Seventh Chords

Four-note chords are built on each step of a major scale with an every-other-note design are called “seventh chords”. See [Scale-Tone Seventh Progression/Constructing Major Scale-Tone Seventh Chords](#). As you can see below, they include four qualities: Major seventh, minor seventh, dominant seventh and minor seventh flat five.

The seventh chord built on step five is a dominant seventh chord, confusingly given the common abbreviated quality name “seventh chord” in the archaic musical tradition. So, C7 is only part of the F major scale, built on the fifth of the F major scale. F7 is only part of the Bb major scale, built on the fifth of the Bb major scale. G7 is only part of the C major scale, built on the fifth of the C major scale.

- Built on step one of its parent major scale, 1-3-5-7, makes a major seventh chord.
- Built on step two of its parent major scale, 2-4-6-1, makes a minor seventh chord.
- Built on step three of its parent major scale, 3-5-7-2, makes a minor seventh chord.
- Built on step four of its parent major scale, 4-6-1-3, makes a major seventh chord.
- Built on step five of its parent major scale, 5-7-2-4, makes a dominant seventh chord.
- Built on step six of its parent major scale, 6-1-3-5, makes a minor seventh chord.
- Built on step seven of its parent major scale, 7-2-4-6, makes a minor seventh flat five chord.

Chord Scales

Key scales are more important perspectives than chord scales. Key scales are more complex, though and they are covered below after chord scales, which are conceptually more straight-forward. For chord scales, you make one modification to a major scale named after the chord.

Each of these seventh chords are constructed with tones 1, 3, 5 and b7 of a major scale named after the chord root. So, F7 uses 1-3-5-b7 or F-A-C-Eb of an F major scale. In each case, the scale is Mixolydian named after the chord root. C uses C Mixolydian, F uses F Mixolydian and G uses G Mixolydian.

Parent scales show the notes used in a key scale or chord scale in the most familiar mode, the major scale. The notes of a major scale can be named after any one of the seven notes, as shown below.

Each of the seventh chords used in a I-IV-V blues (I7, IV7 and V7; C7-F7-G7 in the key of C) are constructed with tones 1, 3, 5 and b7 of a major scale named after the chord root. The seventh chord, used for every chord in this I IV V blues only occurs on the fifth step of a major scale, as shown in the bottom row of each table below.

modes of the C major parent scale

letter name	C	D	E	F	G	A	B
mode name	C Ionian or C major	D Dorian	E Phrygian	F Lydian	G Mixolydian	A Aeolian	B Locrian
scale-tone seventh	C major 7 (C-E-G-B)	D minor 7 (D-F-A-C)	E minor 7 (E-G-B-D)	F major 7 (F-A-C-E)	G7 (G-B-D-F)	A minor 7 (A-C-E-G)	Bm7b5 (B-D-F-A)

5, 7, 2. 4 of the C major scale makes G7 with G, B, D and F notes.. So does 1-3-5-b7 of the G major scale with notes G, B, D and F.

modes of the F major parent scale

letter name	F	G	A	Bb	C	D	E
mode name	F Ionian or F major	G Dorian	E Phrygian	Bb Lydian	C Mixolydian	D Aeolian	E Locrian
scale-tone seventh	F major 7 (F-A-C-E)	G minor 7 (G-Bb-D-F)	A minor 7 (A-C-E-G)	Bb major 7 (Bb-D-F-A)	C7 (C-E-G-Bb)	D minor 7 (D-F-A-C)	Em7b5 (E-G-Bb-D)

5, 7, 2, 4 of the F major scale makes C7 with C, E, G and Bb notes.. So does 1, 3, 5, b7 of the C major scale with notes C, E, G and Bb.

modes of the Bb major parent scale

letter name	Bb	C	D	Eb	F	G	A
mode name	Bb Ionian or Bb major	C Dorian	D Phrygian	Eb Lydian	F Mixolydian	G Aeolian	A Locrian
scale-tone seventh	Bb major 7 (Bb-D-F-A)	C minor 7 (C-Eb-G-Bb)	D minor 7 (D-F-A-C)	Eb major 7 (Eb-G-Bb-D)	F7 (FACEb)	G minor 7 (G-Bb-D-F)	Am7b5 (A-C-Eb-G)

5-7-2-4 of the Bb major scale makes F7 with C, E, G and Bb notes.. So does 1-3-5-b7 of the F major scale with notes C, E, G and Bb.

Therefore, using only the common major scales as a resource for notes, each seventh chord comes from a major scale where it is the fifth step of that major scale. So, for each chord (C7, F7 and G7), you need to figure out what major scale has the root of the chord on its fifth step.

Key Scales For I-IV-V Blues

As stated at the beginning of this Modes On I-IV-V Blues section:

The listener predicts the melody along with the composer or improviser, in that one should mainly compose or improvise what the listener expects. In doing that, the listener expects melodies to be based on a key, with various versions of scales named after the key.

To determine the key scales, find the tone center (C) in each one of the parent scales and use the mode name associated with the scale step on which it occurs.

Putting the focus on “C” satisfies the listeners need for a uniform key. This focus will be done in melody with various devices to emphasize the note C or notes in some kind of C chord. Those melodic devices include:

- ✦ putting the tone center (C) or notes in a tonic chord (some kind of C chord) on the beat, especially the first beat and secondly the beat at a simple division of the bar like half way through on the third beat of four beats
- ✦ ending phrases with the tone center (C)
- ✦ playing the tone center (C) often in the melody
- ✦ a pivot point, where every second note or every third note is the tone center (C)
- ✦ emulating cadences that resolve to C, like emphasizing the notes of a G7 chord which leads

to C, followed by emphasizing the notes of a C chord.

- ✦ playing familiar themes or “licks” that are aurally known to establish the tone center

To satisfy the listeners need for a uniform key by putting the focus on “C” in accompaniment (comping), harmonic devices include:

- ✦ frequent occurrence
- ✦ longer duration
- ✦ chord root (note after which a chord is named) movement up or down a scale to the tonic chord
- ✦ continual occurrence of the chord root of the tonic chord in the bass (even when the chord name is different, such as a G tonic chord combined with a C chord with a G bass)
- ✦ well-known chord sequences called cadences that we have known to establish a chord as a key

Sometimes there may ambiguously be two chords “fighting” for the sense of key, but usually one chord predominates as the tonic chord. Sometimes the ending does not sound final, and a piece may end with a deceptive cadence. In such a case, you are challenged to imagine what the ending chord should be to make the ending of the piece sound final and complete.

Fingering

The most common area for improv (composing melody) in the key of C major (as in the blues in C we are considering) is seventh and eighth position. Those three scales are shown below in the seventh and eighth position area. Each major scale is shown first in its original state with the focus on major scale tone one, playing F for the F major scale and Bb to Bb for the Bb major scale. Afterward, each the F and Bb major scales are shown with the focus on the note “C”, which each of them include.

MODES ON JAZZ BLUES

(also called swing blues)

study [modes on I IV V blues](#) first

The Jazz Blues Chord Progression

C7 (I7)	F7 (IV7)	C7 (I7)	C7 (I7)
F7 (IV7)	F#dim.7 (#IVdim.7)	C7 (I7)	A7 (VI7)
Dm7 (IIIm7)	G7 (V7)	C7 (I7) A7(VI7)	Dm7 (IIIm7) G7(V7)

#IV Diminished Seventh

This common version of the jazz blues (swing blues) chord progression has a IV7 chord in bar 2. After a bar of IV7 in bar five, bar six is #@IVdim7. Sharp #IVdim7 has the same notes as IV7, but with a sharp root. The bass player could still play the root of the IV chord (not sharpened), since the chord could be interpreted as IV7b9, since IV9b9 with no root is #IVdim7.

C7 (I7)	F7 (IV7)	C7 (I7)	C7 (I7)
F7 (IV7)	F#dim.7 (#IVdim.7) = F7b9 (IV7b9) no root	C7 (I7)	A7 (VI7)
Dm7 (IIIm7)	G7 (V7)	C7 (I7) A7(VI7)	Dm7 (IIIm7) G7(V7)

The II-V Cadence

Instead of the V-IV cadence in bars nine and ten of the I-IV-V blues, the jazz blues uses IIIm7 V7. This typically suggests scales with brighter mood, like key major or key Mixolydian, since IIIm7-V7 is created directly from the major scale.

The VI-II-V-I Turnaround

To strengthen the II-V cadence, the jazz blues almost always (except for a few songs like Ray Charles' "It Should've Been Me") precedes the IIIm chord with a VI7. The VI7 is often treated as a V of a minor key, as if IIIm is Aeolian mode (or harmonic minor scale).

Typical Jazz Blues Chord Scales

C7 (I7)	F7 (IV7) F7(b9)	C7 (I7)	C7 (I7)
C Mixolydian	F Mixolydian F Mixolydian b2	C Mixolydian	
F7 (IV7)	F#dim.7 (#IVdim.7) = F7b9 (IV7b9) no root	C7 (I7)	A7 (VI7)

Mixolydian b2 as a chord scale for #IV diminished seventh

Mixolydian b2 is not a well-known scale, but in jazzy melody on a #IV diminished seventh, its notes are often used. If you are using IV Mixolydian (key scale Dorian) on a IV7 chord followed by a #IV diminished seventh or IV7b9 you will play the #4 tone of the key, which is the root of the #IVdim.7 and is the “b9” of the IV7b9. This would actually be using the chord scale IV (F) Mixolydian b2.

F Mixolydian b2 is an F major scale with b2 and b7. Here is an “evolution” of formulas from F major to F Mixolydian b2:

scale	formula	numbered and lettered scale tones.....							
F major scale	(all natural)	1	2	3	4	5	6	7	
		F	G	A	Bb	C	D	E	
F Mixolydian	b7	1	2	3	4	5	6	b7	
		F	G	A	Bb	C	D	Eb	
F Mixolydian b2	b2, b7	1	b2	3	4	5	6	b7	
		F	Gb	A	Bb	C	D	Eb	

The formula for F7b9 is 1-3-5-b7-b9. “b9” is the same as “b2”. “b9” implies “b2” should be voiced in the upper octave. As you can see by the table above, F Mixolydian b2 has all of the notes of F7b9.

Phrygian major as a chord scale for VI7

The VI7 chord will be treated as a V chord of the IIIm, as if the IIIm has a harmonic minor chord scale. The mode for the V chord in harmonic minor has the tones of a seventh chord: 1-3-5-b7. It also has the tones a half step above each note of its major triad basis (1-3-5): b2, 4 and 6 (which make a bII major triad in the key of the chord root).

We'll be using A Phrygian major as the chord scale for VI7. A Phrygian major is an A major scale with b2, b6 and b7. Here is an "evolution" of formulas from A major to A Phrygian major:

scale	formula	numbered and lettered scale tones.....						
A major scale	(all natural)	1	2	3	4	5	6	7
		A	B	C#	D	E	F#	G#
A Phrygian	b2, b3, b6, b7	1	2	b3	4	5	b6	b7
		A	Bb	C	D	E	F	G
A Phrygian major	b2, b6, b7	1	b2	3	4	5	6	b7
		A	Bb	C#	D	E	F	G

simple major modes as chord scales for IIm and V

At first, use the straightforward major modes for IIm and V: II Dorian for the II chord and V Mixolydian. Later, you can do more exotic things like playing a minor II V in their place, or additionally using a melodic minor-based [flat five substitute](#) for the V chord (bII7 instead of V7). See [Flat Five Substitute Chord Progression](#).

We'll be using D Dorian as the chord scale for IIm7 (Dm7). D Dorian is a D major scale with b3 and b7. Here is an "evolution" of formulas from D major to D Dorian:

scale	formula	numbered and lettered scale tones.....						
D major scale	(all natural)	1	2	3	4	5	6	7
		D	E	F#	G	A	B	C#
D Dorian	b3, b7	1	2	b3	4	5	b6	b7
		D	E	F	G	A	B	C

We'll be using G Mixolydian as the chord scale for V7 (G7). G Mixolydian is a G major scale with b7. Here is an "evolution" of formulas from G major to G Mixolydian:

scale	formula	numbered and lettered scale tones.....						
G major scale	(all natural)	1	2	3	4	5	6	7
		G	A	B	C	D	E	F#
G Mixolydian	b7	1	2	b3	4	5	b6	b7
		G	A	B	C	D	E	F

review modes on I IV V blues

If necessary, review [parent scales for I IV V blues](#) before studying the parent scales for the other chords.

I Dorian sharp four for #IV diminished 7

The chord scale for #IV diminished 7 was IV Mixolydian sharp one major which is the mode on the fifth step of major sharp five. In the descending number pattern with the set of modes for major sharp five the modes would be:

mode:	I maj #5	II Dorian #4	III Phry nat3	IV Lyd. #2	#V Mixo. #1	VI Aeo nat.7	VII Loc nat.6
mode:	Bb maj #5	C Dorian #4	D Phry nat3	Eb Lyd. #2	F# Mixo. #1	G Aeo nat.7	A Loc nat.6

For melodic improv, recall blues melody for F7 and F Mixolydian and sharp the F notes. If you are building chords, recall F7 type chords (parts of F13) and sharp the F notes.

The mode on the sixth step of Bb major #5 is G harmonic minor (G Aeolian natural seven). Using this F# Mixolydian sharp one scale (G harmonic minor) can voice lead to the tones of the Gm triad, which is the root, third and fifth of C9 (bar 7), giving the impression that you are progressing to Gm, but actually to Gm as part of C9.

I Mixolydian sharp one scale for VI7

The chord scale for VI7 was Phrygian major which is the mode on the third step of major sharp five. In the descending number pattern with the set of modes for major sharp five the modes would be:

mode:	I maj #5	II Dorian #4	III Phry nat3	IV Lyd. #2	#V Mixo. #1	VI Aeo nat.7	VII Loc nat.6
mode:	F maj #5	G Dorian #4	A Phry nat3	B Lyd. #2	C# Mixo. #1	D Aeo nat.7	E Loc nat.6

For melodic improv, recall blues melody for C7 and C Mixolydian and sharp the C notes. If you are building chords, recall C7 type chords (parts of F13) and sharp the C notes.

The mode on the sixth step of F major #5 is D harmonic minor (D Aeolian natural seven). Using this C# Mixolydian sharp one scale (D harmonic minor) can voice lead to the tones of the Dm triad.

MODES OF FOUR HEPTATONIC SCALES

Four Harmonize-able Heptatonic Scales

A “harmonize-able” heptatonic scale is one of only four heptaonic scales that can produce chords on each scale step by combining three or more notes in an every-other-note pattern (thirds).

The four harmonize-able heptatonic scales are major, harmonic minor, melodic minor and harmonic major. Traditionally, melodic minor is major scale flat three ascending and Aeolian (major scale flat 3, 6 and 7 descending. This course refers to the jazz and modern version of melodic minor that is major flat three ascending and descending.

mode formulas

A mode formula is a set of seven numbers that represent the comparison between a chord, scale or melody. C major scale is 1-2-3-4-5-6-7 and has all natural notes (C-D-E-F-G-A-B). C Mixolydian, by comparison has a “Bb” note instead of a “B”, so the formula for Mixolydian is 1-2-3-4-5-6-b7.

What are the names of the modes built on a major scale for tones 1-2-3-4-5-6-7 are respectively major (Ionian)-Dorian-Phrygian-Lydian-Mixolydian-Aeolian and Locrian. In order with the traditional Roman-numbered tone on which they are built, they are I major (Ionian), II Dorian, III Phrygian, IV Lydian, V Mixolydian, VI Aeolian and VII Locrian

To figure out the modes built on each of the steps of the other three harmonize-able heptatonic scales, follow these four steps: (1) conceive harmonic minor as major scale sharp five and harmonic minor will be the mode on its sixth step; (2) conceive melodic minor as major scale flat three; (3) conceive harmonic major as major scale flat six; (4) use a descending number series in comparing each mode side-by-side with a major scale mode on the same numbered scale tone as shown in the table below.

the descending number series in harmonize-able heptatonic scales

In major sharp five, the descending number series is #5-#4-natural 3-#2-#1-natural 7-natural 6. In melodic minor (major flat three), the descending number series is b3-b2-flat one-b7-b6-b5-b4. In harmonic major (major flat six), the descending number series is b6-b5-b4-b3-b2-flat one.

the cycle for scale tone chords built in thirds

I^{ma}7 is 1357, II^m7 is 2461, III^m7 is 3572, IV^{ma}7 is 4613, V⁷ is 5724, VI^m7 is 46135, VII^m7b5 is 7246.

The color codes are:

major	minor	dominant	diminished	augmented
-------	-------	----------	------------	-----------

How can I identify one of the twenty eight modes of the four harmonize-able heptatonic scales from a collection of seven notes? Answer if it is one of the twenty eight modes, first identify the triad and dominant basis as shown by the colors on the table above. Then narrow it down by the remaining formula. **Major triad basis:** major, Lydian, major b6. **Minor triad basis:** Dorian, Phrygian, Aeolian, melodic minor (major b3), Dorian b2 and Lydian b3 (Lydian diminished). **Dominant seventh basis:** Mixolydian, Phrygian b3 (Phrygian dominant), Lydian b7 (Lydian dominant), Mixolydian b6, Phrygian b4 (super Phrygian) and Mixolydian b2. **Diminished triad basis:** Locrian, Mixolydian #1, Locrian natural 6, Aeolian b5, Dorian flat five and Locrian bb7 (double-flat seven). **Augmented triad basis:** major #5, Phrygian flat one, Locrian b4 (super Locrian) and Aeolian flat one.

Conceive each chord as a summary chord, using four heptatonic scales. The summary chord of each table summarizes the scale-tone for each mode of each scale, such as “Ima9/6#5” beginning the second row in in major #5. *Get to know them.* They are very useful in comping and arranging.

odd-numbered chord names

Odd numbers 7 through 13 immediately after the letter name of a chord imply a dominant seventh (b7), with two exceptions: major (ma, maj, Δ) before the odd number implies a natural seven and diminished (dim, °) implies double flat seven (same as six).

Find the “sameness” of 4 heptatonic minor modes with a focus on their V chords:

- Vm7 (use on V7b9#9) of key Aeolian (V of target is Phrygian)
- V7b9(opt, #5) of key harmonic minor (V of target is Phrygian major). Aeolian’s bVII Mixolydian becomes VII Mixolydian #1.
- V7b9#9(opt.#5) of key Aeolian b1 (from major b6). Target is VI of major b6 scale. V of target is super Phrygian = Phrygian b4 (super Locrian with nat 5)
- V7b5#5b9#9 of key Phrygian b1 (melodic minor mode bIII) V of target is super Locrian

Major Sharp Five and Harmonic Minor Modes

see "[Harmonic Minor Scale Summary](#)".

Harmonic minor is a mode on step six of major sharp five. If you know the modes of the major scale, thinking in major sharp five is a matter of altering one note in each mode. Note the descending number series of altered tones: major #5, Dorian #4, Phrygian natural 3 (raised from b3), Lydian #2, Mixolydian #1, Aeolian natural 7 (raised from b7 to produce harmonic minor) and Locrian natural 6.

mode names →	major #5	Dorian #4	Phrygian dominant (nat. 3)	Lydian #2	Mixolydian #1	Aeolian nat.7	Locrian nat.6

MODAL CHORD SCALES OF FOUR HEPTATONIC SCALES

Chord Scale

A chord scale is the appropriate scale for the current chord, named after the chord root. All tones of the chord should be in the chord scale. The chord scales for groups of chords are commonly modes of the same parent scale. See the chapter [Key Scales, Parent Scales and Chord Scales](#).

In the tables of diagrams below the first diagram in each row is the key scale, the remaining six diagrams on each row show the chord scales on steps two through seven of the key scale. The major key scale can function as a chord scale also, but is shown as a key scale so as to relate the six chord scales on scale tones two through six to it.

Hypothetical Ninths for Melody Only

The Phrygian m7b9 (IIIIm7b9) and Locrian m7b5b9 (VIIIm7b5b9) are not currently accepted as chords. You won't find them in any of the forty or so fake books in circulation. They can be used melodically, however, as long as the flat nine is not sustained, but used as a neighboring tone or passing tone.

MAJOR SCALE MODE (MOOD) CYCLES

Expressive Modes in Order of Darkening

In the tables of diagrams below, the modes are shown in a darkening sequence from left to right. See the earlier section [The Expressive Use of Modes](#). As you progress through each row from left to right, first the sharp four in Lydian mode is made natural, lowering it chromatically (by a half step). This darkens the mood from the exceedingly bright mood of Lydian to the commonplace bright mood of major (Ionian) mode. Continuing to the right in each row flatted tones are accumulated in the order b7-b3-b6-b2-b5 (a numeric order of fourths), progressively darkening the mood.

The mode cycle shown in each row from left to right is major with #4 (Lydian), all natural (major or Ionian), then accumulating flats b7-b3-b6-b2-b5. The mode cycle is **4152637**, which is fifths (Lydian, major, Mixolydian, Dorian, Aeolian, Phrygian, Locrian). The mode cycle of major scale fingering numbers in each row is the same cycle fifths **4152637**. This succession of darkening modes is a common basis of composition, arranging and improvisation.

Use the All Favored playlist in the iReal app to practice loops or entire sections of songs. Here is a link to the file: [All Favored iReal](#) Ireal search criteria will find songs with long durations of the featured key. Also see the [jgleason6 Spotify profile](#). You may need help finding the bullet character. See the instructions below the mode table.

table of Spotify links and iReal "All Favored" playlist abbreviations.

Note that you can search All Favored iReal playlist for both mode and ninth, such as "iMa• ^9!"

mode with Spotify link	iReal mode search	ireal 9th search
major	iMa•	^9!
Dorian	iDor•	m9!!

typing the bullet (•) character

Computers. The bullet (•) character below is option+8 on a computer.

On iOS (iPhone or iPad), tap the 123 key to open the number keypad. Tap the #+= key to go to the second screen of the number keypad and select the bullet point symbol key at the end of the second row. On some versions of iOS, you'll need this alternate method: type and hold the hyphen key to evoke a palette with the bullet.

Android phones. Tap the ? 123 key on the keyboard.

Tap the =< key to go to the second set of symbols on the keyboard.

Select the bullet symbol (•) on the first row to insert it into the messaging or document app.

Hypothetical Ninths for Melody Only

The Phrygian m7b9 (IIIIm7b9) and Locrian m7b5b9 (VIIIm7b5b9) are not currently accepted as chords. You won't find them in any of the forty or so fake books in circulation. They can be used melodically, however, as long as the flat nine is not sustained, but used as a neighboring tone or passing tone.

Key Mixolydian and Dorian with Four Pentatonic Types

begin practice of the mode cycle by playing on I7 IV7 in Blues Styles

See [strict vertical position](#), [seven pentatonic scale types](#) and [reference major scales](#)

The 4152637 cycle. Begin this study by noticing that in any of the fingerings for Mixolydian below, the parent major scale fingering moves to the next number in the 4152637 cycle for Dorian. In changing from Mixolydian to Dorian, E form changed F5 to F2 (F1/2 or F2), D form changed F6 to F3, C form changed F7 to F4 (or F4/5), A form changed F2 to F6 and G form changed F3 to F7 (or F7/1).

7/11 pentatonic is minor pentatonic with a major third. In blues, the b3 is often played before the natural three, even when descending. In "ragtime blues style" the b3 and natural 3 are played with equal duration. In "modern" blues style, the b3 is a brief grace note. Eric Clapton mixes the two styles.

m6/9 pentatonic is major pentatonic with a flatted third.

F2 is fingering 2.

F1/2 is major scale three-note-per-string fingering 1/2.

assignment of scales

On I7, use I7/11 pent, Ima pent and I Mixolydian. On IV7, use I min. pent, I m6/9 & I Dorian

E form ma pent F2	/Mixolydian MS F4/5 (key on "5" for Mixolydian)
E form m6/9 F2	/Dorian MS F1/2 (key on "2" for Dorian)
E form min. pent F1	/Dorian MS F2 (key on "2" for Dorian)
E form 7/11 F1	/Mixolydian MS F5 (key on "5" for Mixolydian)
D form ma pent F3	/Mixolydian MS F6 (key on "5" for Mixolydian)
D form m6/9 F3	/Dorian MS F3 (key on "2" for Dorian)
D form min. pent F2	/Dorian MS F3 (key on "2" for Dorian)
D form 7/11 F2	/Mixolydian MS F6 (key on "5" for Mixolydian)
C form ma pent F4	/Mixolydian MS F7 (key on "5" for Mixolydian)
C form m6/9 F4	/Dorian MS F4 or 4/5 (key on "2" for Dorian)
C form min. pent F3	/Dorian MS F4/5 (key on "2" for Dorian)
C form 7/11 F3	/Mixolydian MS F7 or 7/1 (key on "5" for Mixolydian)
A form ma pent F5	/Mixolydian MS F1/2 (key on "5" for Mixolydian)
A form m6/9 F5	/Dorian MS F6 (key on "2" for Dorian), using a head reach on the third string
A form min. pent F4	/Dorian MS F6 (key on "2" for Dorian)
A form 7/11 F4	/Mixolydian MS F1/2 or 2 (key on "5" for Mixolydian)
G form ma pent F1	/Mixolydian MS F3 (key on "5" for Mixolydian)
G form m6/9 F1	/Dorian MS F7 (key on "2" for Dorian)
G form min. pent F5	/Dorian MS F7 or 7/1 (key on "2" for Dorian)
G form 7/11 F5	/Mixolydian MS F3 or 3/4 (key on "5" for Mixolydian)

SUBSET SCALES AND SUBSET ARPEGGIOS OF MODES

E form

On all of the gray and black-backed diagrams, put the "1" on the desired tone center. On the fingering diagrams (on the far left of each row), put the circled note on the desired tone center. Notes with no colored background are in the mode, but not in the pentatonic. The octatonic version shows the seventh chord in black, the remaining tones are in the mode, except the added #5 or 7 is a chromatic tone. With ninth arpeggios, the middle or low octave is black and the other octave is gray.

The fingering numbers such as F1 or F1/2 refer to the *parent major scale*.

MODAL KEY-SCALE-CYCLE DIAGRAMS

Uses of These Diagrams

The diagrams in this section show the cycle of modes in the same key for the purpose of transcribing, composing, arranging and improvising. Build a strong awareness of these options.

Major Scale Fingering Numbers

In-position major scale fingerings shown below are numbered according to the number of lowest note fingered with the index finger on the sixth, fifth or fourth string. Scale tones are numbered. The scale-tone numbers shown in parenthesis are options, where the same note can be fingered on an adjacent string.

In-Position Fingerings

fingering 1 3 index reaches	fingering 2 2 pinky reaches	fingering 3 no reaches	fingering 4 2 index reaches	fingering 5 4 index reaches	fingering 6 1 pinky reach	fingering 7 no reaches

The in-position fingerings lend themselves to playing chord and arpeggio structures within the scale. Melody is largely an ornamentation of chord tones, so these fingerings work well to improvise. Three-note-per-string fingerings are better suited to playing scale runs, since picking can be the same for every string and the finger patterns are more repetitious and easier to recall. Here are the three-note-per-string major scale fingerings:

Three Note-Per-String Fingerings

fingering 1/2	fingering 2/3	fingering 3/4	fingering 4/5	fingering 5/6	fingering 6/7	fingering 7/1

Three-note-per-string major scale fingerings shown above combine in-position fingerings, and are numbered accordingly. Fingering 1/2 combines in-position fingerings 1 and 2; fingering 2/3 combines in-position fingerings 2 and 3; and so on.

Root ID Versions of Major Scales in Twelve Positions

twelve in-position fingerings, numbered by scale tones and by formula

In this **root ID** naming system, the first number indicates the string where the lowest-octave tone center is located. The second number indicates the fretting hand finger that frets the tone center. 1 = index, 2 = middle, 3 = ring and 4 = little finger. "L" is shown after the number "1" when the index finger reaches one fret toward the head of the guitar for the low-octave tone center ("L" to indicate low pitch). A note in parenthesis indicates an optional location to fret a note on an adjacent string.

This is the most discreet system of positions for the major scale.

6-1 	6-1L 	4-1 	4-1L 	5-4 	5-3
5-2 	5-1 	5-1L 	6-4 	6-3 	6-2

Key-Scale Mode Cycle Diagrams

The seven mode diagrams connected to each circle by bold lines are the fingering diagrams for the each of the seven modes of the major scale. The fingerings are primarily in-position versions and often show optional fingerings for tones in parenthesis. The numbers on the diagrams are numbered scale tones (or altered numbers such as b3). When a note is in parenthesis, it is an option for the same numbered tone on an adjacent string. “6-1” refers to the tone center on the sixth string, fretted with the index (“1”) finger. See [finger orientation](#). For fretting finger numbers in major scale fingerings, see [Prime Scales, Chords and Arpeggios/Major Scale Fingering](#).

the order of modes

As you progress around any of the cycle (circles) of mode diagrams, beginning with Lydian, the modes darken in mood, in the order Lydian, major (Ionian), Mixolydian, Dorian, Aeolian, Phrygian and Locrian. See [Modes In Order of Darkening Moods](#). Additional scales are shown on the far left, the far right and on the top at the right of Locrian. These are notable jazz improv scales.

formula numbers

The numbers within the mode diagrams represent the tones and altered tones of a major scale built on the tone center, in this case, on the C major scale. “b3” would represent “Eb”.

abbreviated formulas

The mode formulas are shown alongside the bold lines that connect them to the center circle. Major is the “model” to which the modes are related, so it has no altered numbers. Lydian has a #4 and Mixolydian has a b7. The remaining modes “accumulate” flats in their formula, as demonstrated in the “altered tones in formula” column in the chart below.

mode	formula	altered tones in formula
Mixolydian	1-2-3-4-5-6-b7	b7
Dorian	1-2-b3-4-5-6-b7	b7, b3
Aeolian	1-2-b3-4-5-b6-b7	b7, b3, b6
Phrygian	1-b2-b3-4-5-b6-b7	b7, b3, b6, b2
Locrian	1-b2-b3-4-b5-b6-b7	b7, b3, b6, b2, b5

finger orientation

In the center circle, just below the key name, two numbers are shown, separated with a hyphen. The first number is the string of the lowest octave tone center and the second number is the finger which frets the lowest octave tone center. “6-2”, for example means sixth string, second finger is the location of the lowest octave tone center. This tone center is common to all of the diagrams in the set around the circle.

Seven-Tone (Heptatonic) Scale Fingerings

The top half of each even-numbered page below (on the “left-facing” pages) shows the fingerings for twenty-eight seven-tone scales (heptatonic scales). There are two versions each of Phrygian dominant and super Phrygian (the second version of each features an augmented triad basis). The finger numbers for the left hand represent:

- 1 index finger
- 2 middle finger
- 3 ring finger
- 4 little finger

When a number is in parenthesis, it is an optional fingering for the same note on an adjacent string.

Subset Triads Elaborated to Ninth

The bottom half of each even-numbered page below (on the “left-facing” pages) shows formula numbers for the twenty-six seven-tone scales.

subset triads

Most of the modes are shown with their triad basis in black.

elaborating to sevenths and ninths

When the seventh and ninth are shown in grey, when they are usable. Arpeggios that have a minor or diminished basis (in black) and have a flat nine, are shown with a grey seven (or flat seven) and the ninth is plain (no black nor grey background). The notes should be conceived and played at first in order of thirds: 1-3-5-7-2. Some of the numbers may have accidentals, such as 1-b3-5-b7-2.

Lydian dominant flat five substitute

Lydian dominant is in the right column of fingerings, next to the top. The flat five substitute for Lydian dominant is based on an augmented triad with tones #4-b7-2 with its root on “#4”, which is equivalent to a flat five of one. The #IV7#5 arpeggio, “#4-b7-2-3” in the key of “1”, makes a 7#5 arpeggio on “#4” (1-3-#5-b7). The #IV7#5#9 arpeggio includes tones “#4-b7-2-3-6”. In the key of “#4”, these #IV arpeggios are in #IV super Locrian mode.

Mixolydian sharp one with a diminished seventh basis

Shown in the lower right corner of each block of fingerings, this shows a sharp one diminished seventh arpeggio (#1-3-5-b7) in black as part of Mixolydian sharp one.

Aeolian flat one with an augmented triad or diminished seventh basis

Shown in the upper right corner of each block of fingerings, Aeolian flat one is based on the “bI augmented triad, shown in black (b1-3-5).

The diagram immediately below “Aeolian flat one aug.” in each block is the same scale featuring diminished seventh arpeggio (#1-2-4-b6) in black. The bI diminished seventh arpeggio has four alternate names: bI dim7, IIdim7, IVdim7 or bVI dim 7.

Subset Triads Elaborated to Pentatonic Add Two and Six

Pentatonic scales based on the model of the common major pentatonic use a triad with an added two and six. The “two” may be two or flat two, the “six” may be six or flat six. Such scales can be called “six-nine” pentatonic scales, using chord-naming conventions. See the chapter “[Chord-Naming Conventions](#).” Major pentatonic is a major triad with an added two and six, which are the notes of a major 6/9 chord (1-2-3-5-6). With a flatted third, major pentatonic would be a *minor* triad with an added two and six, which would make a minor 6/9 chord (1-2-b3-5-6).

Subset Triads Elaborated to Pentatonic Add Four and Seven

Pentatonic scales based on the model of the common minor pentatonic use a triad with an added two and six. The “four” may be four, sharp four or flat four (flat four is the same pitch as three). The “seven” may be seven or flat seven. Such scales can be called “seven-eleven” pentatonic scales, using chord-naming conventions. See the chapter “[Chord-Naming Conventions](#).” Minor pentatonic is a minor triad with an added four and flat seven, which are the notes of a minor seventh chord (1-b3-4-5-b7). With a natural third, minor pentatonic would be a *major* triad with an added four and flatted seventh, which would make a 7/11 chord (1-3-4-5-b7).

“Synthetic” Pentatonic Scales

See the chapter [Scale-Tone Arpeggios and Pentatonics](#)/Modal Pentatonic Scales for examples of common pentatonic scales. Additional pentatonic scales can be conceived. This section (Modes/Modal Key Scale Diagrams) expands the library of pentatonic by basic two pentatonic scales on each of twenty six seven tone scales (an “add 2+6” version and an “add 4+7” version), making fifty-two pentatonic scale types, of which five or ten are in common use. The remaining forty-five or more pentatonic scales could be called “synthetic” pentatonic scales, since they were conceived but not derived from scales in common use.

Like the less common seven-tone scales, these synthetic pentatonic scales can be cautiously worked into your composition and improvisation, being careful to gradually introduce them to your listeners. Most people need familiarity to like the music they are listening to.

Commonality Tables of Subsets of 28 Heptatonic Scales

Each of the twenty eight heptatonic (seven-tone) scales below are shown with three categories of subsets: ninth arpeggios, pentatonic scales that add versions two and six to a triad and pentatonic scales that versions of four and seven to a triad. Subsets are described above, diagramed below in each of seven fingerings areas and listed on the tables immediately below. The first table is grouped by heptatonic scale, the next by ninth arpeggios, then triad+two+six, then triad+4+7. There are two versions each of Phrygian dominant and super Phrygian.

Modal Key Scale Cycle Diagram Pages Named by Major Fingering

The pages of Modal Key Scale Cycle Diagrams below are primarily named by the in-position major scale fingering shown on each half page to the right of the center of the circle, labeled :major". See [Major Scale Fingering/In-Position and Three-Note-Per-String Fingerings](#). In fingering 4, the fingerings are sometimes the three-note-per-string version fingering 4/5.

Mode Variants of Major Scale Fingering 1 (continued)

Mode Variants of Major Scale Fingering 2

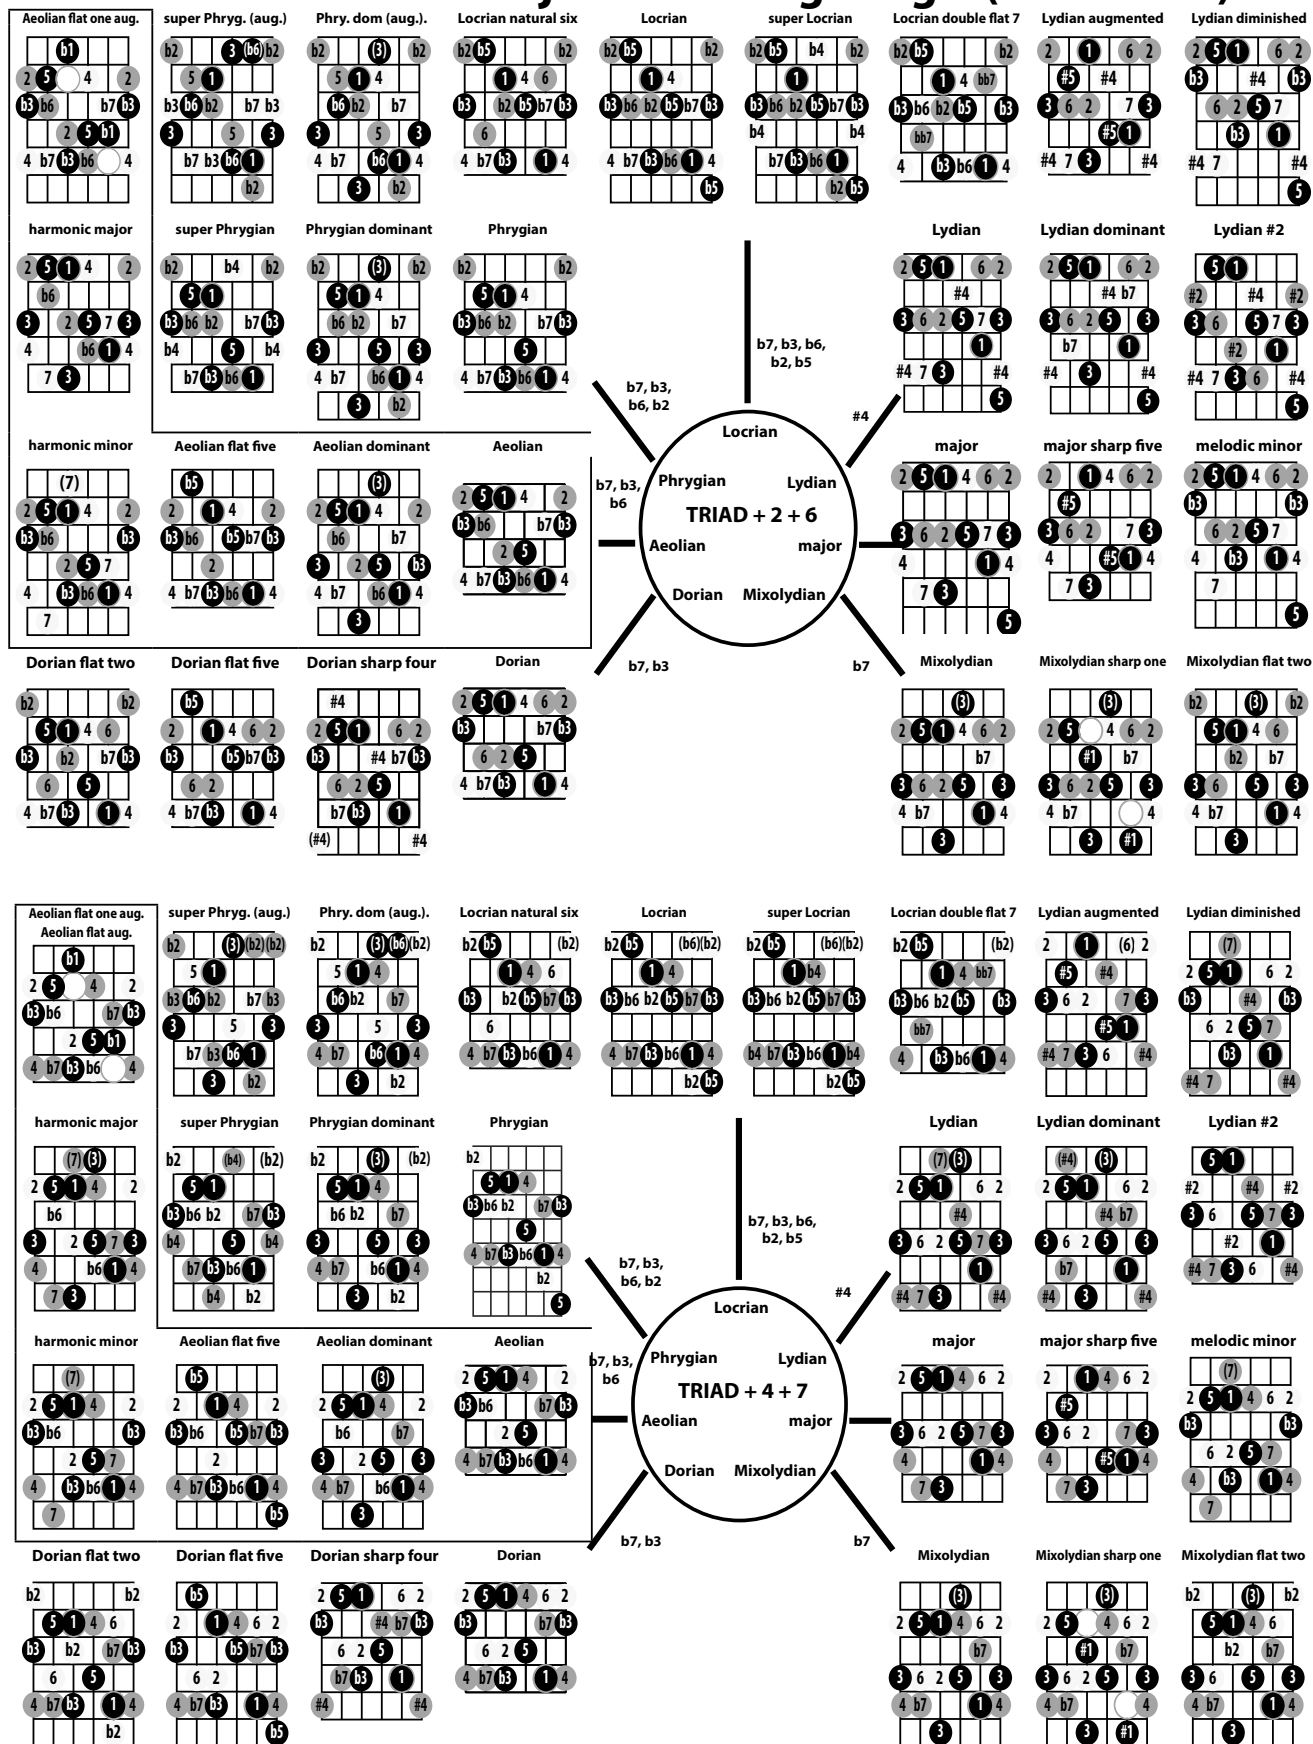

This page displays two sets of fingering charts for 12 modes, arranged around a central circle. The top set is labeled "FINGERING" and the bottom set is labeled "NINTH". Each mode has a corresponding chart showing fingerings for the scale, with some notes circled to indicate specific fingering techniques. The modes are: Aeolian flat one aug., super Phryg. (aug.), Phry. dom. (aug.), Locrian natural six, Locrian, super Locrian, Locrian double flat 7, Lydian augmented, Lydian diminished, Lydian, Lydian dominant, Lydian #2, major, major sharp five, melodic minor, Dorian flat two, Dorian flat five, Dorian sharp four, Dorian, Mixolydian, Mixolydian sharp one, and Mixolydian flat two. The central circle for each set lists the modes and their associated alterations: b7, b3, b6, b2, b5, #4, #5, #6, #7, #8, #9, #10, #11, #12, #13, #14, #15, #16, #17, #18, #19, #20, #21, #22, #23, #24, #25, #26, #27, #28, #29, #30, #31, #32, #33, #34, #35, #36, #37, #38, #39, #40, #41, #42, #43, #44, #45, #46, #47, #48, #49, #50, #51, #52, #53, #54, #55, #56, #57, #58, #59, #60, #61, #62, #63, #64, #65, #66, #67, #68, #69, #70, #71, #72, #73, #74, #75, #76, #77, #78, #79, #80, #81, #82, #83, #84, #85, #86, #87, #88, #89, #90, #91, #92, #93, #94, #95, #96, #97, #98, #99, #100.

MODE FAMILIES

The Aeolian Family

The Aeolian Family is in the “L” shaped box on the upper left of each circle of diagrams in the [Modal Key Scale Cycle Diagrams](#) in the previous section above.

Aeolian Mode Family Study

Songs in this study are:

- The Beatles’ *While My Guitar Gently Weeps*
- Bach’s *Bouree in Em* transposed to Am
- Miles’ version of *Summertime* in Am
- Van Morrison’s *Moondance*
- The Creedence Clearwater version of *I Put a Spell on You* in Em
- Santo and Johnny’s *Sleepwalk* in A
- *Black Orpheus* (*Manha De Carnival*) in Am (written by Luiz Bonfá, popular recordings by Stan Getz, by Astrud Gilberto and by Luiz Bonfá)

Chord progressions for each are shown at the end of this section, with a link to each above.

This illustrates modes in the A Aeolian family, as shown in the “L” shaped area on the left of the circle in [Modal Key Scale Cycle Diagrams](#), the previous section above.

Aeolian, Dorian and harmonic minor

The verses of *While My Guitar Gently Weeps* and Van Morrison’s *Moondance* can both use A Aeolian (b3, b6, b7) in improvising, while the chord progressions in each digresses to other modes of A (as long as the “F” note of A Aeolian is not sustained too long against the “F#” note of A Dorian <b3, b6, b7> or A Melodic minor <b3m nat. 6, nat. 7>). *While My Guitar* verse is A Aeolian during the Am-Am/G and Fm7 chords; A Dorian during the D7 chord; A harmonic minor during the “E” chord; and A major during section B. Dorian is Aeolian with natural six. Harmonic minor is Aeolian with natural seven.

melodic minor

Bach’s *Bouree in Em* transposed to Am uses A melodic minor in ascending and descending form, as shown in the bracketed area of bar 2.

Miles' version of Summertime in Am uses chord from A melodic minor (Am6-E7/), while improv could use A Aeolian or A harmonic minor, as long as the "F" note of A Aeolian or A harmonic minor is not sustained too long against the "F#" note of A melodic minor.

Van Morrison's Moondance uses A Dorian during the Am7-Bm7 chords, while improvisers would typically could use A Aeolian or A harmonic minor, as long as the "F" note of A Aeolian or A harmonic minor is not sustained too long against the "F#" note of A Dorian.

Aeolian flat five

A Aeolian flat five could be used for mood darkening during any of these A minor progressions.

Dorian sharp four (mode IV of harmonic minor)

Dorian sharp four could be used during the Am chord in I Put a Spell on You.

Aeolian flat one (synonym of Lydian sharp two, sharp five)

A Aeolian flat one could be used during the "E" chord at the end of section B of While My Guitar Gently Weeps as a secondary root on the E chord, thinking of A Aeolian flat one as its enharmonic "G#" with the scale type Lydian #2, #5,

harmonic major

A harmonic major could be used during the Dm chord of Sleepwalk in A.

Aeolian dominant

A Aeolian dominant could be used during Em7b5 and A7 in the fifth and six bars of section B in Black Orpheus.

	B-	∴	E	∴ } ∴

two-part arrangement of Bach's *Bouree in Em* transposed to Am

$\text{♩} = 140$

A mel. min. ascending A mel. min. descending (same as A Aeolian)

The musical score is written for two staves in 4/4 time. It begins with a tempo marking of quarter note = 140. The key signature has one sharp (F#), indicating the key of A major or its relative minor, F# minor. The piece is a two-part arrangement of Bach's Bouree in E minor, transposed to A minor. The first system includes annotations for 'A mel. min. ascending' and 'A mel. min. descending (same as A Aeolian)'. The third system features a triplet of eighth notes marked with '2' and '3'. The fourth system has a triplet of eighth notes marked with '3'. The piece concludes with a double bar line in the sixth system.

- **Chords and Scales by Numbered Type**

USING MODES IN IMPROV

mode, tone center, key, tonic chord

A chord progression is a group of chords played in a defined order. A mode uses a single note as a (tone center) tonal focus, making a tone center on that note, based on a major or minor chord named after the note (the tonic chord). The tone center is constantly in the listener's mind, establishing a key. The chord progression provides a varying harmonic background, while the tone center is a constant harmonic theme expected to sound at the end. The set of notes used along with the tone center create a seven-note scale called a mode. Start your improv studies on chord progressions that use one unchanging tone center and one unchanging mode. Chord progressions can change tone center and can change mode.

Determine the Key and Mode

Major uses the key (tone center) on "1" of a major scale, Dorian on "2", Mixolydian on "5" and Aeolian on "6". If you're playing in "A Aeolian", the key is "A" and "A" needs to be on "6" of a major scale ("A" is on the "6" of C major scale). If you're playing in "A Dorian", the key is A (it may be called A minor, but can be specified as "A Dorian", which is a specific minor mode). In A Dorian, the tone center is on two of a major scale ("A" is on the "2" of the "G" major scale. See the chapter [Modes](#).

To look up all these modes of major scales, see the Table of Modes Of Parent Major Scales below. It is also in the chapter [Modes/Discovering the Parent Major Scale for a Given Mode/A Tone Center As a Different Numbered Tone In Seven Major Scales](#).

tonic chord

Many chord progressions that can be melodically represented with a tonic chord. The tonic chord the key is the chord you would expect the chord progression to end on to sound final in a traditional sense, like the ending of an nineteenth century symphony (like Beethoven's Fifth Symphony). A tonic chord may have three or more unique notes. A triad is a chord with three unique letter-named notes (C-Eb-G). The simple three-note triad versions of a tonic chord on the four common major scale modes are:

- a major triad arpeggio used for major mode, named after the note on step one of the parent major scale
- a minor triad arpeggio used for Dorian mode, named after the note on step two of the parent major scale
- a major triad arpeggio used for Mixolydian mode, named after the note on step five of the parent major scale
- a minor triad arpeggio used for Aeolian mode, named after the note on step six of the parent major scale

“summary chord”

The tonic triad can be used as a “summary chord” throughout many chord progressions, by basing a melody on its notes. For the summary chord (tonic chord) to work, the listener must be enabled to keep the summary chord in mind while experiencing the entire chord progression. To enable the summary chord it must share many notes with most of the chords. Any chords it doesn't share many notes with need to be relatively brief, well under half the time duration of the progression. The duration of a chord that doesn't share two or more notes with the summary chord is best at two seconds or less in duration.

Start improving on chord progressions that support a summary chord, as described above. Choose progressions with a prominent tonic chord. When you try playing the tonic triad arpeggio (A minor for A Dorian or A Aeolian, a major for A major or A Mixolydian), it should sound okay over the entire progression.

Table of Modes of Parent Major Scales

build your basic scale and arpeggio performance ability

First, develop your ability to ascend and descend arpeggios through an increasing range of pitch, starting with an octave or less. Practice these scales and arpeggios, in E form and A form tone centers for the desired mode first:

- Triad arpeggios for the chosen mode, shown on [Parent Scale and Key Scale Fingerings](#), in the pentatonci row, playing only the numbered notes with black-circled background.
- Pentatonic scales for the chosen mode, shown on [Parent Scale and Key Scale Fingerings](#), in the pentatonic row, playing the numbered notes with black-circled background and the notes with gray-circled background.
- Seven-tone scales (heptatonic scales) for the chosen mode, shown on [Parent Scale and Key Scale Fingerings](#), in the seveth arpeggio row playing all the notes: those numbered with black-circled background, gray-circled background and those with no background.
- Ninth-chord arpeggios on [Parent Scale and Key Scale Fingerings](#), in the ninth arpeggio row, ascending and descending in order of pitch the notes in black and the notes in gray separately first. Once you are comfortable playing the black and gray tones separately, (1) ascend one set (black or gray) to its highest pitch, descend one scale tone to the lowest tone of the other set and ascend that second set and (2) descend one set (black or gray) to its highest pitch, ascend one scale tone to the highest tone of the other set and descend that second set.

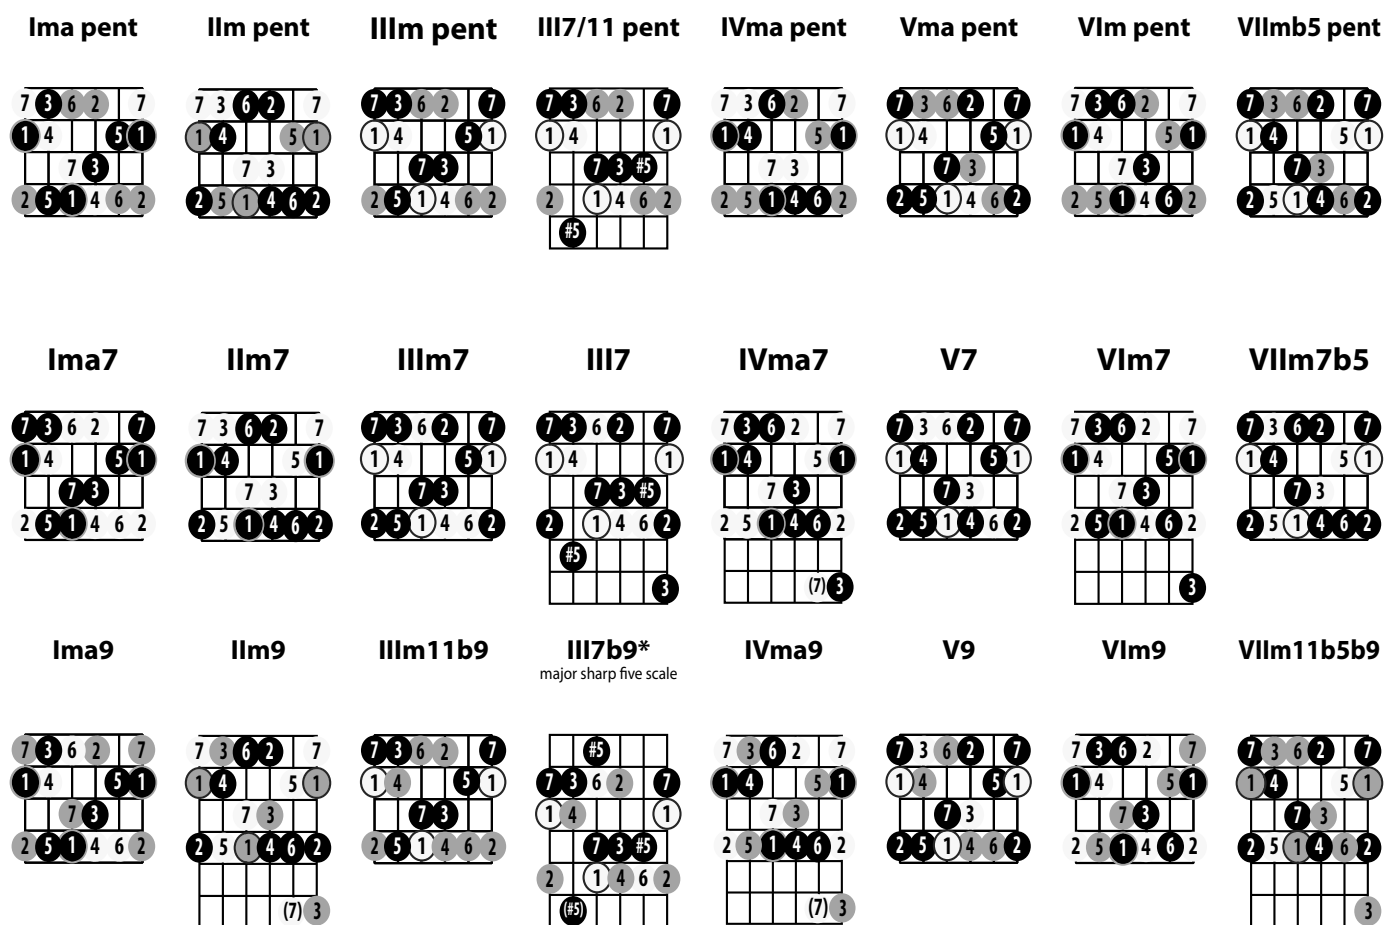

PARENT SCALE AND ARPEGGIO FINGERING

These are numbered in the key of the parent major scale, not by the key of the pentatonic scale or the arpeggio. Notice that the numbered tones are identical in all the diagrams in the same row, except the III7 column which uses major scale sharp five. In the pentatonic row, the black-backed notes are the triad arpeggio and the combined black-backs *and* gray-backs are the pentatonic scale. In the seventh arpeggio rows, the black tones are the seventh arpeggios. In the ninth arpeggio rows, the black-backed versus gray-backed notes show the ninth arpeggios in different octaves.

On the ninth arpeggio rows, III7b9 without its root is a diminished seventh, which can be named after any of its remaining four notes shown in gray: #Vdim7, VIIdim7, IIdim7 or IVdim7.

Also see [Key Scales, Parent Scales & Chord Scales/Parent Scale and Key Scale Fingerings](#) and see Voice Leading Improv with Arpeggio Cadences/Graphically Voice Leading Improv with Arpeggio Cadences/[Scale-Tone Seventh Arpeggios in Perfect Fourths Order, Numbered By Parent Major Scale](#) (includes secondary dominants).

INCORPORATE RHYTHMS, SLURS, DECORATION AND MELODIC CELLS

The mode is commonly on I, II^m, V or VI^m of a parent major scale. The example in “build your ability to play these arpeggios and scales” is in the key of VI minor, where the key is E^m and the parent scale is G major.

build your ability to play these arpeggios and scales:

- The E^m triad arpeggio (black notes only on [Parent Scale and Key Scale Fingerings](#) in the VI^m7/11 pentatonic column and in the C form parent section).
- E^m pentatonic (notes with a black circle and notes with a gray circle on [Parent Scale and Key Scale Fingerings](#) in the VI minor pentatonic column and in the C form parent section).
- E Aeolian (all notes on [Parent Scale and Key Scale Fingerings](#) in the VI pent. column and in the C form parent section).
- E minor ninth arpeggio on [Parent Scale and Key Scale Fingerings](#) in the ninth arpeggio row (the gray notes show one octave and the black notes show another). Ascending and descend sequences of only notes with a black circle, then only notes with a gray circle. When combining them, ascend up to “7” (6-1-3-5-7) in (black or gray). You can begin the other octave (in the other color) by descending one note to “6” and ascending 6-1-3-5-7 from it. Or you can descend to begin the other octave descending one color to “6” (7-5-3-1-6), ascending one note to “7”, then descending 7-5-3-1-6 on the other color.

USE THE SCALES AND ARPEGGIOS IN THESE WAYS

1. linearly, up and down the scale or arpeggio with regular metronomic rhythm, build your speed playing 2, 3 then four notes per beat (you may need to leave 4 notes per beat for later).
2. Add varied rhythm (see [Improv with Four-Pulse Rhythms](#) below).
3. Add slurring with hammers, pull-offs, slides and bends. Use pentatonic scales with bends (optional), especially bending to chord tones 1, b3 and 5. See Pentatonic Bend Exercises, below.
4. Bebop Ornamentation (see [Core Melody with Baroque-Bebop Ornamentation/Bebop Ornamentation Slurring Rules](#)).
5. Add more [Melodic Cells](#), like [Chromatized Arpeggios](#).

Pentatonic Bend Exercise - [link to video](#)

Bends occur only on the first three strings in this exercise. Each note bends to the next higher scale tone, except any note fretted with the index finger that would have to bend three frets (a step and a half) doesn't bend. Unbent notes are still played, since they are the reference pitch for the next bent note.

- Likewise, releases should be carefully sustained, so they can be reference pitches for the next note (except not the last bend).
- Two-fret (whole step) bends on the first two strings with the index finger are substituted with the middle finger (optionally aided by the first finger). Substituting the ring finger for the index finger should not be done in the exercise, since it puts you in the next lower-numbered fingering the cycle of fingerings 1-2-3-4-5-1 etc. (fingering 2 would change to fingering 1 and fingering 1 would change to fingering 5).
- From about the fifth fret or higher, the index finger can perform a two fret bend on the third string, with a lever action, using the base of the index finger as a fulcrum point. Below the fifth fret on the third string, the middle finger (optionally aided by the index finger) could be substituted.

fingering 5

Major Scale Bending Exercise

Bends occur only on the first three strings in this exercise. Each note bends to the next higher scale tone.

- The index finger can perform half step bends on any string.
- Two-fret (whole step) bends on the first two strings with the index finger are substituted with the middle finger (optionally aided by the first finger). Substituting the ring finger for the index finger should not be done in the exercise, since it puts you in the next lower fingering in the 1-2-3-4-5-6-7-1 cycle (fingering 3 would change to fingering 2, fingering 2 would change to fingering 1 and fingering 1 would change to fingering 7).
- From about the fifth fret or higher, the index finger can perform a two fret bend on the third string, with a lever action, using the base of the index as a fulcrum point. Below the fifth fret on the third string, the index (optionally aided by the middle finger) could be substituted.

IMPROV WITH FOUR-PULSE RHYTHMS

Play along with these 4-pulse rhythms below, each strummed in the video on an A chord changing to a D chord. Use these rhythms to play the scale in preparation of improv:

Each of the rhythms below use six notes, so they are good for playing changing the rhythm of two triplets into eighth notes or sixteenth notes.

1. strum one of the pairs of four-pulse rhythms (i.e all four/2-3) on muted strings, using rhythmic strumming, where your hand is moving continuously down-up and you are selecting from that metronomic rhythm which strokes you are hitting the strings in order to make the desired rhythm/

2. Next, use the same rhythmic strumming directions to perform rhythmic picking on a single note. If you have trouble looping it (repeating it seamlessly), go back and forth from strumming muted strings to picking a single string until you are comfortable with rhythmic picking on a single string.
3. Then, use the same rhythmic picking directions to play a sequence of two or three notes on a single string.
4. Now, use the same rhythmic picking to play a sequence of three or four changing notes (i.e. E-F-G-F on the second string each time) on one string and the same number of changing notes on an adjacent string (i.e. A-B-C-B on the first string each time) and alternate between the two strings. You could be progressive by playing the sequence twice in a row on each string, then once one each string. No pausing, of course.
5. Next, play a continuous sequence of five notes in a major scale between two strings (i.e. V pos. second and first string ascend E-F-G-A-B-C, descend B-A-G-F, repeat).
6. Then expand the exercise to progressively more strings until you can play a major scale fingering through all six strings in a single position. Don't necessarily design the exercise to start each instance on the same note each time, yet it may be a good idea to start on the same note each time at first, since you are multi-tasking. Let it be more random. In an improvisation, there should be some repeated design and some variation.

CHORDS AND SCALES BY NUMBERED TYPE

Numbered Type

parent scales other than major

Parent scales may be one of three variants of the major scale:

- ✦ melodic minor (major scale with flat three)
- ✦ major sharp five (its mode VI is harmonic minor)
- ✦ major flat six (also called harmonic major)

Along with the major scale, this makes four seven-note (heptatonic) scales. All of them are harmonizable, meaning they can be played in thirds (groups of three or more notes in an ever-other-note sequence such as 1-3-5 or 2-4-6) to make chords. They do not have two consecutive half steps (Hungarian minor has two half steps with #4-5-b6: 1-2-b3-#4-5-b6-7-1).

Prefer Summary Chords

Generally use more summary chords in your improv, where you are playing over two or more chords (or an entire chord progression) with the tonic chord, used to summarize the key. See [Summary Chord](#).

a variable number of summary chords for a given chord progression

A chord progression can be interpreted different ways. You may, for example, be able to use single summary chord for an entire progression or split the progression up and use the key summary chord for part of it and a temporary key summary chord for another part. For example, in Breezin', the chord progression is: Dma7-Bm7-Em7-A7. You could either use D major chord and D major scale for the entire progression or use D major for Dma7-Bm7 and use and E minor chord and E Dorian for Em7-A7.

using the relative minor option

Even though a song is in major, based on I major of a major scale (D major for Breezin'), you could treat it as if it was in its relative minor key on VI minor of the major scale. Breezin' could be treated as if it were on Bm and B Aeolian VIm of a D major scale, instead of on I of a D major scale this works because there are versions of the I chord D and the VIm chord Bm that have the same notes. D6 and Bm7 share the same notes. This produces a darker, cooler mood. See [Substitution/Shared Thirds: Secondary Roots](#).

SCALE SYNONYMS (MODES)

Scales are shown with formula numbers, which are scale-tone numbers in relation to a major scale named after the tone center (in this case, "C"). Arpeggios and chord fingerings are shown in this course with finger numbers on the grid, formula numbers below.

Scale Synonyms of Major Scale Modes Shown with Fingerings

The C major scale is shown below, illustrated in the traditional manner by playing up and down an octave from C to C.

C major (Ionian mode) for one octave

T														
A														
B	8	5	7	8	5	7	4	5	4	7	5	8	7	5

By playing the C major scale in a range of two octaves, you can then extract portions that range from each note up and down an octave and create the modes of C major.

C major (Ionian mode) for two octaves

T																										
A

Four Harmonize-able Seven Tone Scales

heptatonic scale

A *heptatonic* scale is a seven-tone scale.

harmonize-able heptatonic scales

Only four heptatonic scales can produce currently acceptable chords on each scale step by combining three or more notes in an every-other-note pattern (thirds). They are major, harmonic minor, melodic minor and harmonic major. Traditionally, melodic minor is major scale flat three ascending and Aeolian (major scale flat 3, 6 and 7 descending. This course refers to the jazz and modern version of melodic minor that is major flat three ascending and descending.

formulas

A set of seven numbers that represent the comparison between a chord, scale or melody. C major scale is 1-2-3-4-5-6-7 and has all natural notes (C-D-E-F-G-A-B). C Mixolydian, by comparison has a "Bb" note instead of a "B", so the formula for Mixolydian is 1-2-3-4-5-6-b7.

modes of the four harmonize-able heptatonic scales

What are the names of the modes built on a major scale? Answer: modes 1-2-3-4-5-6-7 are respectively major (Ionian)-Dorian-Phrygian-Lydian-Mixolydian-Aeolian and Locrian. In order with the traditional Roman-numbered tone on which they are built, they are I major (Ionian), II Dorian, III Phrygian, IV Lydian, V Mixolydian, VI Aeolian and VII Locrian.

To figure out the modes built on each of the steps of the other three harmonize-able heptatonic scales, follow these four steps: (1) Conceive harmonic minor as major scale sharp five and harmonic minor will be the mode on its sixth step; (2) conceive melodic minor as major scale flat three; (3) conceive harmonic major as major scale flat six; (4) use a descending number series in comparing each mode side-by-side with a major scale mode on the same numbered scale tone as shown in the table below.

the descending number series

There is a descending number series in harmonize-able heptatonic modes other than major. In major sharp five, the descending number series is #5-#4-natural 3-#2-#1-natural 7-natural 6. In melodic minor (major flat three), the descending number series is b3-b2-flat one-b7-b6-b5-b4. In harmonic major (major flat six), the descending number series is b6-b5-b4-b3-b2-flat one.

Shared Chords in Different Modes of the Same Major Scale

Compositions in the modes of a major scale can use the same chords for different modes, as you can see and hear with the “Shared Chords in C major and A Aeolian” example below. The same is true for all modes of any major scale. All the modes can use the same chords. Compositions in each mode establish the key on the tone center of that mode in various ways. See [Establishing a Key/Establishing Keys with Melody and Chord Progression](#).

KEY SCALE, PARENT SCALE AND CHORD SCALE

Key and Chord Root

What does that mean a song is said to be in a key? It means there is a main note that is the focal point of the whole piece of music. It can be defined in various ways, but a favorite is: “the root of the chord you would expect the piece to end on (in a traditional sense, as in the common practice period of classical music from 1600 to 1900)”.

A chord “root” is the lowest imaginable note in a chord. You can play a “C” major chord with a “G” in the bass (one of its three notes), but if you imagine the lowest note played in the bass in a classic ending, the lowest imaginable note would be “C”. For common chords (triads,, sevenths, ninths), organizing the notes of the chords in thirds (F-A-C-E-G-B-D-F, etc.) would show the chord root as the lowest pitch.

T
A
B

authentic and deceptive cadences

What is meant by “you would expect the piece to end on”? A cadence is a chord progression of two or three chords that establishes a key or temporary sense of key. An authentic cadence sounds finished and progresses from a chord built on the fifth step of the key (G major) to one built on the first step (C major). A deceptive cadence can end on an unexpected chord, like ending on an “F” chord in the key of “C”. In a deceptive cadence, the melody usually ends on a note that is in the expected chord *and* in the alternate chord.

In the Deceptive Cadence example below, the melody progresses to the note “E” at the C#m chord, where you would have expected an E chord. The melody note “E” is ambiguous, since it is in E and C#m. This progression to C#m is a deceptive cadence. The piece ends with an authentic cadence, repeating the last phrase ending on “E” in the melody, this time on the expected “E” chord.

deceptive cadence [link to video](#)

Three systems of musical notation for a deceptive cadence in E major. Each system shows a treble staff with notes and a guitar fretboard diagram below. The first system covers measures 1-4, the second measures 5-8, and the third measures 9-10. Chords are labeled above the staff: E, G#m, A, B(sus4), E, G#m, A, B7, A, B7, C#m, A, B7, E. The guitar diagrams show fingerings for the right hand (T, A, B) and left hand (0, 2, 4, 6, 7, 5, 2, 0, 2, 4, 1, 2). A 'deceptive cadence' bracket spans measures 7-8, and an 'authentic cadence' bracket spans measures 9-10.

Deceptive cadences have been used often enough in pop music the twentieth century and later that it may be difficult to conceive an authentic cadence that ends on the chord the key is named after. To gain this sense of a final ending, listen to old music from the baroque and classical period of western art music. For the baroque period, listen to music by Antonio Vivaldi, Johann Sebastian Bach and George Frideric Handel. For the classical period, listen to Joseph Haydn, Wolfgang Amadeus Mozart and Ludwig van Beethoven.

Key Scale

The key is named after the note that you expect to be the bass note of the ending chord (in a traditional sense, see [Key and Chord Root](#) above and see the chapter “[Establishing a Key](#)”). A key scale is the appropriate scale for the current chord group that is named after the key. Most tones in the chord group should be in the key scale.

Using the key scale concept retains your focus on the eventual target chord that the key is named after for both you and the listener. By continually thinking in terms of one major scale, you'll be able to more effectively retain the sense of key. The examples in this study are therefore shown in relation to the C major parent scale. The key is C major or A minor ("A" is relative minor or "C"). During the VII III VI part of the chord progression, the key is VI minor (A minor).

Parent Scale

Parent scales uses the major scale as the common basis of all of its modes. See [Scale Synonyms \(Modes\)](#) and the [Modes](#) chapter.

A parent scale is the major scale (or of one of the three other harmonize-able seven-tone scales) which is the origin of a key scale or chord scale.

A "I" chord (a "one chord") would always have the same chord scale and key scale. This allows you to think in the most familiar context for fingerings and structures like scale-tone chords. See also [Key Signatures/ the relative major and minor system](#), Scales for Songs in All Keys/[Parent Scale](#); Introduction to Improvisation/Using Scales and Chords in Improv/[Key Scales, Parent Scales and Chord Scales](#); Modes/[Key Scale, Parent Scale and Chord Scale/Parent Scale](#); Modes/Modes on I-IV-V Blues/[Key Scale, Chord Scale and Parent Scale in Blues](#); Key Scales/[Key Scale, Chord Scale and Parent Scale](#); Substitution/Five Categories of Substitute Chords/[Identify the Parent Major Scale](#).

Parent Scales for Secondary Dominants and for Flat Five Substitutes

On the following pages, parent scales are shown in five octaves shapes (E form, D form, C form, A form and G form) with the secondary dominant and melodic minor variants of each parent major scale.

Secondary dominants can occur on each parent major scale tone except scale tone V, where it is already a dominant chord. For each secondary dominant a different tone of the parent major scale is altered, such as major scale sharp five to make a III7b9/Phrygian major dominant.

Lydian dominant is used a a flat two of a target, such as F13#11 to target Em7. In each case, a modal synonym can be conceived, so you can still think in key scale. See Secondary Dominant/[The Flat Five Substitute of a Secondary Dominant](#).

Chord Scale

A chord scale is the appropriate scale for the current chord, named after the chord root. All tones of the chord should be in the chord scale. The chord scales for groups of chords are commonly modes of the same parent scale.

PARENT SCALE AND KEY SCALE FINGERINGS

Legend of Symbols on Parent Scale and Key Scale Fingerings

the header row

E form parent	LOCRIAN	PHRYGIAN	AEOLIAN	DORIAN	MIXOLYDIAN	MAJOR	LYDIAN
	VIIIm7/11b5 pentatonic	IIIIm7/11 pentatonic	VIIm7/11 pentatonic	IIIm7/11 pentatonic	V ma 6/9 pentatonic	I ma 6/9 pentatonic	IV ma 6/9 pentatonic
	VII dim.	III minor	VI minor	II minor	V major	I major	IV major

The gray box at the left of this row shows the octave shape of the parent scale tone center. See “[Note Sets, Structure and Design](#)”/Octave Shapes and [Key Scale, Parent Scale and Chord Scale](#) in this chapter.

The top of each cell in the header row (other than the gray cell) lists one of the seven modes of the major scale (Locrian). Below the mode name is the common pentatonic scale name for that mode (VIIIm711b5 pentatonic). See “[Pentatonic Scales and Octave Shapes](#)”. The Roman numeral (VII) is the scale tone on which the pentatonic scale is built, followed by the descriptive name of the pentatonic scale in the form of a chord name, as described in “[Pentatonic Scales and Octave Shapes](#)”.

The bottom of every cell in the header row (except the gray one) on left-facing page names the scale tone triad for that step by number and quality. “VII dim.” is a diminished triad built on the seventh step of the parent major scale.

numbering each left versus right facing page

The numbering of each tone on left-facing pages are in terms of the parent scale. On each right-facing page, the numbers are shown with the chord root or tone center as “1”. For the C major parent scale, “D” in D Dorian would be “2” on the left facing page and would be “1” on the right-facing page.

the first row of diagrams -triad, pentatonic and mode

In this first row of diagrams, the diagram at the far left with no black nor grey backgrounds is the parent major scale, Where “1” (C) is the tone center of the parent major scale (C major). The black-backed numbers in each diagram are the triad tones, as named the bottom of the header cell (VII diminished). The gray-backed numbers are the tones added to the triad to complete the pentatonic scale. So, the black and gray notes combined makeup the pentatonic scale. The remaining notes without black nor gray

background complete the major scale mode (VII Locrian). For an example the mode, play an octave from one tone center to another, in numbered order.

the second row of diagrams - six-tone scales

The second row of diagrams is the same as the first, except an extra gray note completes a six-tone (sextatonic) scale rather than a pentatonic scale. These are used to harmonically establish a triad. See [“Six-Tone Scales”](#).

the third row of diagrams - seventh arpeggios

The third row of diagrams shows the major scale-tone seventh arpeggios with black background and the remaining tones with no background. See [“All Scale-Tone Chords”](#)/[Major Scale-Tone Chords](#). All numbered tones with or without black backgrounds make up the parent major scale and its mode. To play an example of the mode, play one octave up or down from one tone center to another. For Mixolydian on a left-facing page, play from “5” to “5”. For Mixolydian on a right-facing page, play from “1” to “1” in the diagram below “V7”.

the fourth row of diagrams - ninth arpeggios

The fourth row of diagrams shows the major scale-tone ninth arpeggios with black background in one range from root to ninth (or partial range) and ninth arpeggios with gray background in another range from root to ninth. On a left-facing page, ascend from the root (“6” for VIIm9) in gray or black. When you reach the ninth (the fifth note), descend one scale tone to begin the next-higher octave in the other

color. The procedure is the same on a right-facing page, except the root is “1” and the ninth is “9”. When descending, go down to the root, then up one scale tone to find the ninth of the lower octave and descend in the other color.

The remaining tones with no background complete the mode. See “[All Scale-Tone Chords](#)”/Major Scale-Tone Chords. All numbered tones with or without black backgrounds make up the parent major scale and its mode. The VIIIm11b5 and IIIIm11b9 arpeggios in the first two columns are hypothetical and not in common use as chords.

the fifth row of diagrams - secondary dominant arpeggios

The fifth row of diagrams shows secondary dominants, which dramatize the progression to the next chord to the right (VI9 goes to IIIm). IV9 can progress to VIIIdim, but rarely. Each secondary dominant becomes a V of the target chord to its right. See “[Secondary Dominant](#)”.

the sixth (bottom) row of diagrams - flat five substitute

The bottom row of diagrams shows arpeggios for flat five substitute chords, which are substitutes for the secondary dominants shown the the row above. They effectively become a “flat two of target”, rather than a “V of target”. If “C” is the target, “G” is the secondary dominant root (V of C), while “Db” is the flat five substitute root for “G” (Db is bII of C).

Scales and arpeggios are in perfect fourth order. See the [legend](#) at the beginning of this section.

THE ORDER OF MELODIC IMPORTANCE

A song is a journey along a melodic path through periodic harmonic environments. The key is the root of the journey's harmonic essence, as in a pilgrimage to mecca.

As a musician, it is important to make sense to your audience. People can relate better to melody in a vocal context which implies that melody should be structured more in terms of key scale than chord scale.

order of melodic importance

Heinrich Schenker, probably the most notable music analyst of the twentieth century, developed a layered structural analysis of music now called Schenkerian analysis. When I first came across his work in the 1980's, I was thrilled, since it closely paralleled the way I thought about music. There is a foreground, middle ground and background (or more layers could be conceived), where music is given an order of melodic importance.

In chordal music, such as American jazz and pop this order of melodic importance works like this: In the foreground, the primary chord tones are implied. In the middle ground, the subtle shades of the chords color are defined. In the background, the remaining scale tones function as neighboring tones. Further back, are the remaining chromatic tones. The definition of each layer is flexible and can be conceived in regards to key scales and chord scales.

importance of the middle ground

It is particularly effective to develop your ability to paint tonal color in the middle ground. This requires an extensive knowledge and technical facility with arpeggios and pentatonic scales. Pentatonic scales often get a bad reputation by jazz musicians because of their common use in blues and pop. However, if you look at them as versions of arpeggios and consider a great number of types, they are indispensable tools. Great players like Chick Corea, John McLaughlin and Herbie Hancock would agree with the appreciation for the value of a great variety of pentatonic scale types, I guarantee you.

In my Encyclopedia Of Licks that follows, there are twenty pentatonic scale types. Those types are based on two models: the triad plus four and seven; and the triad plus two and six.

establishing the key scale

Practice improvising or composing a melody with key scales and separately, practice making a melody with chord scales. Can you hear the compartmentalization caused by chord scales and the unity provided by key scales? Listen to great improvisers such as John Coltrane, Miles Davis, Chick Corea and George Benson with the key scale versus chord scale in mind.

When chords have many common tones, it is easier to establish a key scale melody. When chords do not have many common tones, such as Im7 to IIm7 or Im to V7b9, versions of the chords can be conceived

that do cause common tones. On Im7 to IIIm7, for example Im9 provides a “2” common to the IIIm7 chord. Im7/11 provides a “4” common to the IIIm7. IIIm7/11 provides a “5” common to the Im7.

The most universal common tone is “5”. It is in: I major, minor and dominant types (not those with #5 or b5); IIIm7/11 or II7sus4; IIIIm7; IVm9 or IV9; all type of V; VIm7 or VI7.

“2” Is a good common tone. It’s Ima9, Im9 and I9; II, all types; IIIIm7 or III7; IV6; V minor and dominant types (not #5 or b5); VIm7/11 or VI7sus4; VIIIm7b5 or VIIIm7.

In major key swing music, “6” is a good common tone: it is in I6 or Im6; IIIm7 or II7; IIIIm7/11 or II7/111; IV major or dominant; V9 or Vm9; all types of VI; VIIIm7b5 and VIIIm7.

“4” can be a common tone to: IIIm7; III7b9; all types of IV; V7 or Vm7; VIIIm7b5.

DETERMINING THE SCALE

Adding the 2, 4 and 6 to Seventh Chords

the most important modes are circled

major scale	major Ima7 2-4-6 (Ionian)	Dorian IIIm7 2-4-6	Phrygian IIIIm7 b2-4b6	Lydian IVma7 2-#4-6	Mixolydian V7 2-4-6	Aeolian VIIm7 2-4-b6	Locrian VIIIm7b5 b2-4b6

Scales for Altered Dominant Chords

b5 Lydian dominant (Lydian b7, mel. min. mode IV), using the #4 scale tone as a b5 chord tone
#5 Mixolydian b6 (melodic minor mode V), using the b6 scale tone as a #5 chord tone
 b5.#5 whole tone scale (9b5#5)
b9 Phrygian dominant (harmonic minor V)
#9.... Mixolydian in low range of pitch, Dorian in high range
b9.#9.... Diminished half-whole scale (13 b9#9#11)
#5.b9 Phrygian dominant (harmonic minor V), using the b6 scale tone as a #5 chord tone
 b5b9.#9.... Diminished half-whole scale (13b9#9#11), using the #4 scale tone as a b5 chord tone
 b5.#5.b9.#9.... Locrian b4 (melodic minor VII)

Scales for Diminished Chords

modes of harmonic minor or harmonic major

Modes II, IV, bVI and VII of harmonic minor or of harmonic major, (which is major flat six) can be used over diminished seventh chords.

The diminished seventh modes of harmonic minor are equivalent to major sharp five modes #V, VII, II and IV. The diminished seventh modes of harmonic major are bVI, VII, II and IV.

diminished half/whole scale

The harmonized version of this scale would make the chord I13b9#9#11 (C13b9#9#11) and can make two diminished chord sounds. Either Im6b5 (Cm6b5 is another name for C diminished seventh that implies the melodic use of the flatted third, flatted fifth and the sixth), or I7b9 no root (C7b9 no root equals Db dim7, E dim7, G dim7 and Bb dim7).

- ✦ The diminished scale could be conceived as a diminished seventh arpeggio with a lower chromatic embellishment to each tone to make a Im6b5 sound.
- ✦ The diminished scale could be conceived as a diminished seventh arpeggio a diminished seventh chord build on the tone a half step above the tone center of the diminished scale to make a I7b9 no root chord sound. This would be used where the diminished half/whole scale (C diminished half/whole scale) is a “V type” scale, where C diminished half/whole scale would be used as C13b9#9#11, a “V chord” in the key of “F”.

SCALE FINGERINGS

Primary Major Scale Fingerings

four fret major scale

four-fret major scale, some five-fret on strings 1 and 2

These avoid the use of double whole steps on the larger strings, in the interest of speed when playing scalar passages.

in-position major scale

The longer in-position major scale fingerings are not well-suited for scalar patterns, but are more useful in creating harmonic structures. In playing a scale where there are duplicate notes on strings two and three, play either note (not both).

three-note-per-string major scale

These work well for fragment patterns and very fast linear playing. Four-note per string fingerings are faster, however.,

Primary Seven Tone Scale Fingerings

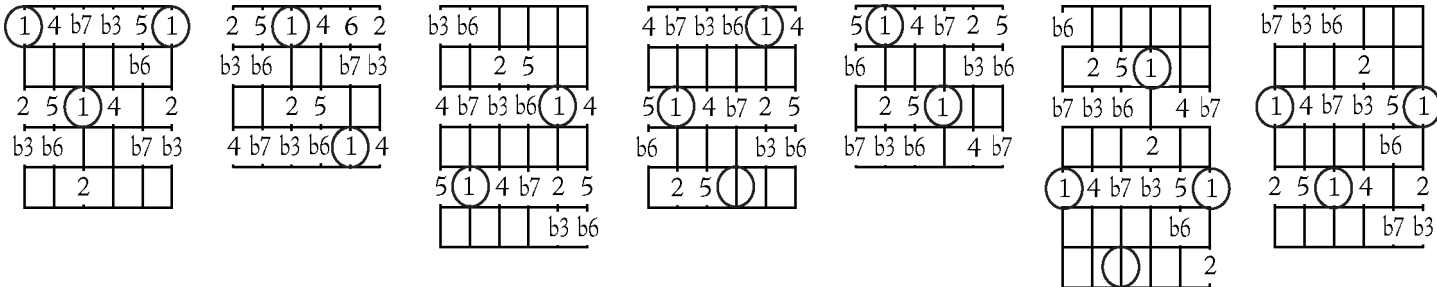

major scale

major scale sharp five

major scale flat three**major scale flat six****Modal Fingering****major scale****Dorian**

Phrygian**Lydian****Mixolydian****Aeolian****Locrian**

major scale sharp five

Diagram showing fingerings for the major scale sharp five across six systems of guitar strings. The diagrams are arranged in two rows of three. The first row shows the scale on strings 1-6, and the second row shows the scale on strings 2-7. The diagrams include various fingering patterns and accidentals (sharps) for the fifth degree. A note indicates "or wide range (next page)" for the second system in the first row.

melodic minor (major scale flat three)

Diagram showing fingerings for the melodic minor scale across six systems of guitar strings. The diagrams are arranged in two rows of three. The first row shows the scale on strings 1-6, and the second row shows the scale on strings 2-7. The diagrams include various fingering patterns and accidentals (flats) for the third degree. A note indicates "or wide range (next page)" for the second system in the first row.

Phrygian Flat One**Locrian Flat Four****Major Scale Sharp One**

Diagram showing fingerings for the Major Scale Sharp One across seven systems of guitar strings. The diagrams are arranged in two rows. The first row shows the scale on strings 1-6, and the second row shows the scale on strings 2-7. The diagrams include various fingering patterns and accidentals (sharps) for the first degree.

Figure 1 displays seven 4x4 grids, each representing a different voicing of the F#m7b9 chord. The grids are arranged in a single row. Each grid contains numbers 1-7 and accidentals (b6, b9) representing notes. Circled numbers indicate the root (1) and the b9 (9).

- Grid 1: Row 1: 1, 4, 7, 3; Row 2: 2, 5, 1, 4, 2; Row 3: b6, 7, 3, 1; Row 4: 3, 2, 5, 7, 3.
- Grid 2: Row 1: 2, 5, 1, 4, 2; Row 2: b6, 7, 3, 1; Row 3: 3, 2, 5, 7, 3; Row 4: 4, b6, 1, 4.
- Grid 3: Row 1: b6, 7, 3, 1; Row 2: 3, 2, 5, 7, 3; Row 3: 4, b6, 1, 4; Row 4: 7, 3, 1, 4.
- Grid 4: Row 1: 4, 7, 3, 1; Row 2: 5, 1, 4, 2, 5; Row 3: b6, 7, 3, 1; Row 4: 2, 5, 1, 3.
- Grid 5: Row 1: 5, 1, 4, 2, 5; Row 2: b6, 7, 3, 1; Row 3: 7, 3, 2, 7; Row 4: 1, 4, 5, 1.
- Grid 6: Row 1: b6, 7, 3, 1; Row 2: 2, 5, 1, 3; Row 3: b6, 4, 7, 3; Row 4: 7, 3, 2, 7.
- Grid 7: Row 1: b6, 7, 3, 1; Row 2: 2, 5, 1, 3; Row 3: b6, 4, 7, 3; Row 4: 7, 3, 2, 7.

the numbers on the diagrams below are finger numbers

Figure 1 displays six diagrams illustrating the first three fingerings for the 12-tone scale. Each diagram is a 4x4 grid of notes, with arrows or circles indicating fingerings.

- fingering 1:** Shows a sequence of fingerings (1, 2, 3, 4) across the notes.
- fingering 2:** Shows a sequence of fingerings (2, 3, 4, 1) across the notes.
- fingering 3:** Shows a sequence of fingerings (3, 4, 1, 2) across the notes.
- fingerings 1 & 3:** Shows a sequence of fingerings (1, 3, 1, 3) across the notes.
- fingerings 1 & 2:** Shows a sequence of fingerings (1, 2, 1, 2) across the notes.
- fingerings 2 & 3:** Shows a sequence of fingerings (2, 3, 2, 3) across the notes.

Constructing Chords in the Key of the Chord Root

- **Outline of Procedures**
- **Choose a Chord Quality and a Fretboard Area**
- **Choose a Major Scale Fingering**
- **Build a Major Seventh Fingering**
- **Build a Dominant Seventh Fingering**
- **Build a Minor Seventh Fingering**
- **Preferred Chord Tones**
- **Voicing Chord Tones**

OUTLINE OF PROCEDURES

Basic Construction

To construct each arpeggio and chords from the arpeggio, perform each of these steps in order:

- ✦ choose a chord quality
- ✦ chose a fretboard area
- ✦ in the key of the chord root, and in the position (fretboard area) you have chosen, play a major scale fingering, thinking it by number
- ✦ play all instances of each note in the chord: all of the roots (“1’s”), thirds (“3’s”), etc.
- ✦ for each string, from the sixth (largest) to the first string, determine which of the chord tones are available
- ✦ in order from the sixth to the first string, play all of the available chord tones in order of pitch, making an arpeggio
- ✦ construct chord fingerings by playing one of each of the unique notes in the arpeggio (i.e. 1-3-5-7). There are usually many possible chord fingerings

Refining Your Construction

Expand your capabilities by learning which chord tones are preferred and which can be omitted. A thirteenth chord has seven notes, so one or more notes must be omitted on a six-string guitar to strum all the chord tones of a thirteenth chord at once. See the last two sections of this chapter: [Preferred Chord Tones](#) and [Voicing Chord Tones](#).

CHOOSE A CHORD QUALITY AND A FRETBOARD AREA

Start with seventh chords. Major seventh is good to start with. Here's a list of common qualities:

<u>chord name</u>	<u>abbreviation</u>	<u>formula</u>
major	(blank after letter name)	1, 3, 5
minor	m	1, b3, 5
diminished triad	dim	1, b3, b5
augmented triad	aug	1, 3, #5
suspended fourth	sus4	1, 4, 5
suspended second	sus2	1, 2, 5
5 (i.e A ⁵ or C ⁵)	5 (i.e A ⁵ or C ⁵)	1, 5
major seventh	ma7	1, 3, 5, 7
dominant seventh	7	1, 3, 5, b7
dominant seventh, sharp five	7#5	1, 3, #5, b7
dominant seventh, flat five	7b5	1, 3, b5, b7
minor seventh	m7	1, b3, 5, b7
minor seventh, flat five	m7b5	1, b3, b5, b7
minor, major seventh	m(ma7)	1, b3, 5, 7
diminished seventh	dim7	1, b3, b5, bb7 (6)
major ninth	ma9	1, 3, 5, 7, 9
dominant ninth	9	1, 3, 5, b7, 9
dominant thirteenth	13	1,3,5,b7,9,11,13
dominant seventh, sharp ninth	7#9	1, 3, 5, b7, #9
dominant seventh, sharp eleventh #11	7#11	1, 3, 5, b7,
minor ninth	m9	1, b3, 5, b7, 9
minor ninth, flat five	m9b5	1, b3, b5, b7, 9
dominant seventh, sharp nine, flat thirteen	7#9b13	1, 3, 5, b7, #9, b13
six nine	6/9, 69	1, 3, 5, 6, 9
seventh, suspended fourth	7sus4	1, 4, 5, b7
major seventh, suspended fourth	ma7sus4	1, 4, 5, b7
add nine	add 9	1, 3, 5, 9
minor add nine	m add 9	1, b3, 5, 9
dominant seventh, no third	7no3	1, 5, b7

CHOOSE A MAJOR SCALE FINGERING

Memorize a major scale fingering by number. Any of these can be moved up and down the fretboard, but stay in the middle of the fretboard, from approximately frets three to twelve.

A major IV fingering 7 scale tones	Bb major V fingering 7 scale tones	B major III fingering 6 scale tones	C major IV fingering 6 scale tones	C# major IV fingering 5 scale tones	Db major IV fingering 5 scale tones	D major V fingering 5 scale tones
fingers	fingers	fingers	fingers	fingers	fingers	fingers
Eb major IV fingering 4 scale tones	E major IV fingering 3 scale tones	F major V fingering 3 scale tones	F# major III fingering 2 scale tones	Gb major III fingering 2 scale tones	G major IV fingering 2 scale tones	Ab major IV fingering 1 scale tones
fingers	fingers	fingers	fingers	fingers	fingers	fingers

You can also use octave shapes to conceive playing chords, scales or melodies in all keys in one area of the fretboard. All of the fingerings above are in the fourth or fifth position, meaning the index finger is hovering over the fourth or fifth fret.

Fingerings one through seven are numbered in relation to the lowest-pitched tone fretted with the index finger on the sixth string. In fingerings 7, 6, 3 and 2, the position is numbered in relation to the lowest-pitched tone on the sixth string. In fingerings 5, 4 and 1, the position is one fret higher than the lowest-pitched tone on the sixth string.

Strict Vertical Position

This concept is primarily used for single-note playing of melodies, scales and arpeggios. Position is numbered after the fret at which your index finger is placed. In that position, the other three fingers are assigned one of the next three frets in-a-row toward the body of the guitar. In other words, each of the four fingers are assigned to one of four consecutive frets.

The examples below show the first string. The position numbers would be the same, regardless of which string the fingers were placed upon.

You can also reach one fret out-of-position with the index and little fingers:

head reach and body reach

A head reach is a reach out of position toward the head of the guitar with the index finger, shown above where the index finger is used twice on the same string. A body reach is a reach out of position toward the body of the guitar with the little finger, shown above where the little finger is used twice on the same string.

side step

A *side step* is a temporary change of position before returning to the original position. It usually involves notes in the temporary position on only one or two strings. In fingering six of C major scale below, most of the scale is fingered in fifth position (with the index finger at the fifth fret), but there is a side step where the notes on the third string are fingered in fourth position. In fingering two of C major scale below, most of the scale is fingered in tenth position (with the index finger at the tenth fret), but there is a side step where the notes on the fourth and third string are fingered in ninth tenth position.

BUILD A MAJOR SEVENTH FINGERING

Practice building major seventh arpeggios first, since they are common and don't modify the major scale. Major seventh is constructed with major scale tones 1-3-5-7, which is called its *formula*. Here is the A major scale, fingering 7 in IV position, for example.

Locate All the Instances of Each Chord Tone within the Major Scale

In the major scale fingering you have chosen to memorize, there should be two or three instances of each numbered tone 1, 3, 5 and 7 in the major scale fingering. Locate all the instances of each.

BUILD A DOMINANT SEVENTH FINGERING

Dominant sevenths are more common than major sevenths, but bring a little complexity.

A dominant seventh chord is constructed with major scale tones 1-3-5-b7. Here is the A major scale, fingering 7 in IV position, along with A Mixolydian, which has the flatted seventh we need. To change “7” to “b7” in any major scale fingering, either move it one fret toward the head of the guitar or change “7” to “b7” located one fret toward the body of the guitar from “6”. Flattening the seventh in any major scale fingering will change it to another major scale fingering pattern, as you can see where fingering 7 below has changed to fingering 4/5. If you play fingering 4/5 from “4” to “4” below, you’ll hear a D major scale.

A major IV
fingering 7

A Mixolydian III
fingering 4/5

Locate All the Instances of Each Chord Tone within the Mixolydian Scale (major flat seven)

Memorize the Mixolydian scale fingering below. There should be two or three instances of each numbered tone 1, 3, 5 and b7 in the Mixolydian scale fingering. Locate all the “1’s”, then all the “3’s”, then the “5’s”, then the “b7’s”.

BUILD A MINOR SEVENTH FINGERING

Minor sevenths are more common than major sevenths and like dominant sevenths, are a little complex to build. A minor seventh chord is constructed with major scale tones 1-b3-5-b7. Here is the A major scale, fingering 7 in IV position, along with A Dorian, which has the flatted third and flatted seventh we need. To change “3” to “b3” in any major scale fingering, either move it one fret toward the head of the guitar or change “3” to “b3” located one fret toward the body of the guitar from “2”. Change “7” to “b7” in any major scale fingering by either moving it one fret toward the head of the guitar or change “7” to “b7” located one fret toward the body of the guitar from “6”. Flattening the seventh in any major scale fingering will change it to another major scale fingering pattern, as you can see where fingering 7 below has changed to fingering 1/2. If you play fingering 1/2 from “b7” to “b7” below, you’ll hear a G major scale.

A major IV

fingering 7

A Dorian III

fingering 1/2

Locate All the Instances of Each Chord Tone within the Dorian Scale (major flat three and flat seven)

Memorize the Dorian scale fingering below. There should be two or three instances of each numbered tone 1, b3, 5 and b7 in the Dorian scale fingering. Locate all the “1’s”, then all the “b3’s”, then the “5’s”, then the “b7’s”.

PREFERRED CHORD TONES

The Third, Seventh and Altered Tones Specified in the Chord Name

Since music relies heavily on the human imagination, all notes of a chord don't have to be included to suggest its sound. The essential notes most necessary to suggest a chord's sound are:

**“the third and the seventh (if part of the chord)
and any tone specified by the chord name”**

Roots are usually implied by the chord progression and can be omitted, especially in chords of four or more different notes (such as seventh or ninth chords). An exception is in the first presentation of a chord progression in a solo guitar piece (or a solo piece for any chording instrument, like the piano), where it may be preferable to play chord roots in the bass to clearly define the chord progression.

Many chord tones are implied by our familiarity with a chord and can be imagined when they are left out. These include unaltered fifths in any chord, ninths in eleventh chords, ninths or elevenths in thirteenth chords and any one of the tones in a diminished seventh chord.

Use your own discretion in preserving the emotive quality of a chord when you omit notes. In one arrangement, it may be fine to omit the ninth in a ninth chord and only play a seventh chord, while in another arrangement, the ninth may be essential in producing the mood or may be an important note in [voice leading](#). A note may be essential because it is a common tone with other chords, or where the series of notes created by the highest note (or lowest note) in each chord in a series of chords creates an ascending or descending scale.

The Root and Fifth Can Usually be Omitted and Still Imagined

In this twelve-bar jazz blues chord example, you can play the chords and imagine a bass line or other instruments and hear the progression as being in the key of C, while no “C” note was played in any of the chords! Each diagram is one bar.

VOICING CHORD TONES

Voice Ninth, Eleventh and Thirteenth Tones High

Ninth and higher chord tones should be voiced in middle to high range of pitch, Except a flat nine in a dominant seventh type chord where the flat nine is sometimes used in the bass. In the example below, the chord progression is IIm7-V13b9-Ima7 in the key of D. The “9” of the V chor (A13b9), a “Bb” note, implies resolution to the fifth of the Dma7 chord, the “A” note on the sixth string. The “A” note on the sixth string doesn’t necessarily have to be played. If you play the second example below, where the Dma7 has “D” in the bass on the fifth string, you can still hear the resolution by imagining the “Bb” resolving to “A”.

<p>IIm7 Bm7 VII</p> <p>1 b7 b3 5</p>	<p>V13b9 A13b9/Bb V</p> <p>b2 b7 3 6</p>	<p>Ima7 Dma7 V</p> <p>5 1 5 7 3</p>
<p>IIm7 Bm7 VII</p> <p>1 b7 b3 5</p>	<p>V13b9 A13b9/Bb V</p> <p>b2 b7 3 6</p>	<p>Ima7 Dma7 V</p> <p>1 5 7 3</p>

When the Top Note Is a Melody Note Stay a Minor Third Below It

In the example below, the notes on the first string are intended to make a melody with the notes E-D-C. In the last chord, the “C” note on the first string is obscured by the “Bb” note on the second string, a whole step (two frets in pitch) below the C. The “C” melody note on the last chord can more clearly be heard in the second row of chords below, where the interval from the “G” on the second string to the “C” on the first string in the last chord is two and a half steps a five-fret interval,

Constructing Scale-Tone Chords by Keyscale

- **Outline of Procedures**

- **Melodic Minor Scale-Tone Chords**
- **Harmonic Major Scale-Tone Chords**
- **Heptatonic Scale-Tone Full-Tertian Arpeggios**
- **Heptatonic Scales with Tertian Fingerings**

OUTLINE OF PROCEDURES

Four Harmonizable Heptatonic Parent Scales

Heptatonic scales contain seven notes per octave. It is standard practice to harmonize heptatonic scales in thirds, using an every-other-note pattern (1-3-5-7, etc.), since listeners have found that system of harmony pleasing to the ear, beginning in England in the twelfth century. Extended chords larger than sevenths like ninth and thirteenth chords became increasingly more prevalent from the beginning of the twentieth century, especially in jazz and blues.

Four particular heptatonic scales can be harmonized in thirds to make acceptable chords and can be used as models to build modes. They are major (Ionian), harmonic minor, melodic minor and harmonic major. Major can be used as a master parent scale for the other three, since major flat three is melodic minor, major sharp five contains the mode harmonic minor on its sixth step and major flat six is harmonic major. See the chapter [Modes/Modes of Four Heptatonic Scales](#).

Scale-Tone Arpeggio Construction

To construct each arpeggio and chords from the arpeggio, perform each of these steps in order:

- Choose one of the four parent scales: major, harmonic minor, melodic minor or harmonic major. It's usually best to start with major (Ionian), since all the others can be viewed as variants of major. Tables of all the scale-tones chords are shown later in this chapter.
- Choose a scale-tone chord from your chosen parent scale. For example: IIm7 in the major scale (Dm7 in the C major scale).
- Choose a fretboard area (also called a position, see [Strict-Vertical Position](#)), and play one of the Favored Fingerings for your chosen parent scale as shown in [Heptatonic Scale-Tone Full Tertian Arpeggios](#). Each of the four scale-tone chord sections in this chapter include a list of the numbered scale tones in triads, seventh chords and ninth chords.
- In the key of the parent scale you have chosen and in the fretboard area you have chosen, play your chosen arpeggio, thinking of it by scale-tone numbers. IIm7 (Dm7) in the C major parent scale would be 2-4-6-1. Ascend and descend the arpeggio in order of pitch from the sixth to the first string and back.
- Using the "Key of the Chord Root" method in "[Constructing Chords in the Key of the Chord Root](#)", also learn to play the arpeggio thinking its formula. Dm7 (IIm7) would be 2-4-6-1 of the parent C major scale, but would be 1-b3-5-b7 in the key of the chord root, D major.

Using Preferred Tones in Chord Construction

Expand your capabilities by learning which chord tones are preferred and which can be omitted. A thirteenth chord has seven notes, so one or more notes must be omitted on a six-string guitar to strum all the chord tones of a thirteenth chord at once.

Seventh chords can be voiced without a fifth or without a root, still implying the entire chord. See the chapter “[Scale-Tone Seventh Progression](#)”/Start with Three-Note Seventh Chords.

See the last two sections of this chapter: [Preferred Chord Tones](#) and [Voicing Chord Tones](#).

STRICT-VERTICAL POSITION

This concept is primarily used for single-note playing of melodies, scales and arpeggios; not for chords. The rules of strict vertical position specify which finger would be used to fret each of thirty-six note locations on the fretboard through a range of six frets on all six strings.

fifth position

Position is numbered after the fret at which your index finger is placed. In that position, the other three fingers are assigned one of the next three frets in-a-row toward the body of the guitar. In other words, each of the four fingers are assigned to one of four consecutive frets.

The examples below show the first string. The position numbers would be the same, regardless of which string the fingers were placed upon.

fifth position

sixth position

seventh position

You can also reach one fret out-of-position with the index and little fingers:

fifth position

sixth position

seventh position

head reach and body reach

A head reach is a reach out of position toward the head of the guitar with the index finger, shown above where the index finger is used twice on the same string. A body reach is a reach out of position toward the body of the guitar with the little finger, shown above where the little finger is used twice on the same string.

side step

A *side step* is a temporary change of position before returning to the original position. It usually involves notes in the temporary position on only one or two strings. In fingering six of C major scale below, most of the scale is fingered in fifth position (with the index finger at the fifth fret), but there is a side step where the notes on the third string are fingered in fourth position. In fingering two of C major scale below, most of the scale is fingered in tenth position (with the index finger at the tenth fret), but there is a side step where the notes on the fourth and third string are fingered in ninth tenth position.

major sharp five and harmonic minor modes

Harmonic minor is a mode on step six of major sharp five scale. If you know the modes of the major scale, thinking in major sharp five is a matter of altering one note in each mode. Note the descending number series of altered tones: major #5, Dorian #4, Phrygian natural 3 (raised from b3), Lydian #2, Mixolydian #1, Aeolian natural 7 (raised from b7 to produce harmonic minor) and Locrian natural 6.

HEPTATONIC SCALE-TONE FULL-TERTIAN ARPEGGIOS

Heptatonic

Heptatonic scales contain seven-notes per octave. Pentatonic scales contain five notes per octaves. Hexatonic scale contain six notes per octave. Octatonic scales contain eight notes per octave. See the chapters [Pentatonic Scales and Octave Shapes](#), [Six-Tone Scales](#), [Major Scale Summary](#), [Harmonic Minor Scale Summary](#), [Melodic Minor Scale Summary](#), [Harmonic Major Scale Summary](#) and [Bebop and Other Octatonic Scales](#).

Tertian

“Tertian” refers to a structure of thirds. In full-tercian arpeggios, each note is a scale tone third from the next. They are a continuous series of every-other-note, using the numbered cycle 1-3-5-7-2-4-6, repeat. They can build major scale-tone arpeggios constructed in thirds (every-other-note).

Each fingering contains two full-tercian arpeggios, one shown in black, the other in gray. From bass treble, the fingering below ascends 7-2-4-6-1-3-5-7-2 in black and ascends 1-3-5-7-2-4-6-1-3 in gray.

Each of these full-tercian arpeggios contain smaller arpeggios. For example, major scale-tone IIm13 ascends with major scale tones 2-4-6-1-3-5-7. Each three consecutive tones of 2-4-6-1-3-5-7-2-4 makes a triad. 2-4-6 is a II minor triad, 4-6-1 is a IV major triad, 6-1-3 is a VI minor triad, 1-3-5 is a I major triad and 3-5-7 is a III minor triad. Each four consecutive notes of 2-4-6-1-3-5-7-2-4-6 make a seventh chord. 2-4-6-1 is IIm7, 4-6-1-3 is IVma7, 6-1-3-5 is VIm7 and 1-3-5-7 is Ima7.

Each five consecutive notes of major scale-tone 2-4-6-1-3-5-7-2-4-6-1 makes a usable ninth chord if the ninth chord is currently acceptable to listeners. Five of the possibilities are acceptable. 2-4-6-1-3 is IIm9, 4-6-1-3-5 is IVma9, 6-1-3-5-7 is VIm9, 1-3-5-7-2 makes Ima9 and 5-7-2-4-6 makes V9. Building a ninth on the “3” (3-5-7-2-4), would result in IIIIm7b9, which is not currently an acceptable chord. Likewise, building a ninth on the “7” (7-2-4-6-1), would result in VIIIm7b5b9, which is not currently an acceptable chord.

major scale-tone IIm15 and V13 arpeggios include the other tertian arpeggios

A IIm15 arpeggio includes all the notes of IIm13, IVma13#11, VIm11, Ima9, IIIm7 and V major. A V13 arpeggio includes all the notes of V15, VIIIm11b5b9, IIm9, IVma7 and VI minor. These two arpeggios, IIm15 and V13 include all the other usable major scale tone arpeggios built in third. So it makes sense to memorize their fingerings.

Making the II minor chord a hypothetical IIm15, where the root and the fifteenth is the same note two octaves apart, allows making the maximum subset chords. The V13 chord allows making the remaining major scale-tone tertian chords not part of the IIm15. VIIIm7b5b9 is a usable arpeggio, but not an acceptable chord. In the use of VIIIm7b5b9 as an arpeggio, the “b9” tone needs to resolve to its upper or lower neighbor (root or flatted third). See the table below.

IIm15 and V13 subset arpeggios

	on root	on third	on fifth	on seventh	on ninth	on eleventh
IIm15	IIm13	IVma13#11	VIm11	Ima9	IIIm7	V major
V13	V13	VIIIm11b5b9	IIm9	IVma7	VI minor	n/a

Using Full-Tertian in Composing and Improvising

See “[Commonality Chords](#)”, “[Substitution](#)” and “[Abbreviating and Elaborating Chord Progression](#)”.

Building Scale-Tone Arpeggios from Full Tertian

Ascend each of the arpeggios for fingering 7 in both “lowest full tertian” and “other full tertian with the limits shown below for each (IIIm7 is 3-5-7-2). Notice the *parent major scale* upper limit is “2” or “3” and the lower limit is most often thought of as II or V, sometimes VI.

scale-tone chord	numbers of parent	quantity
Ima9	1-3-5-7-2	5 notes
IIm13	2-4-6-1-3-5-7	7 notes
IIIm7	3-5-7-2	4 notes
IVma13#11	4-6-1-3-5-7-2	7 notes
V9	5-7-2-4-6	5 notes
VIm11	6-1-3-5-7-2	6 notes
VIIIm7b5	7-2-4-6-(1-3)	4(6) notes
currently acceptable as an arpeggio, not as a chord		
Ima13	1-3-5-7-2-4-6	7 notes
IIm15	2-4-6-1-3-5-7-2	8 notes
IIIm11b9	3-5-7-2-4-6	6 notes
V13	5-7-2-4-6-1-3	7 notes
VIIIm11b5b9	7-2-4-6-1-3	6 notes

HEPTATONIC SCALES WITH TERTIAN FINGERINGS

Categories of Fingerings

in-position fingerings

In-position fingerings use a strict vertical position fingering, where four consecutive frets are each assigned a finger. The index has an option of reaching an additional note one fret toward the head of the guitar. The little finger has an option of reaching an additional note toward the body of the guitar. See [Strict Vertical Position](#).

three-note-per string fingerings

Each three-note-per string fingering combines fingering on the four bass strings (six through three, the four largest strings) of one in-position fingering with the fingering on the two treble strings (one and two, the smallest) of the next in-position fingering toward the body of the guitar.

Full-Tertian Fingerings

In [Prime Scales, Chords and Arpeggios/Seven-Tone Scales in Seven Areas with Tertian Fingerings in Black and Gray](#), the rows of fingerings with black and gray circled backgrounds show full tertian fingerings. The numbered tones in black are every other scale tone. The numbered tones in gray are the second set of every other scale tone. The ascending series of numbered tones for each color are 1-3-5-7-2-4-6 (repeat). The full tertian fingerings for major scale are below in both in-position and three-note-per-string versions. There are other sets for major scale sharp five (harmonic minor), melodic minor and harmonic major in [Prime Scales, Chords and Arpeggios/Seven-Tone Scales in Seven Areas with Tertian Fingerings in Black and Gray](#).

Major Sharp Five (harmonic minor on 6), In-Position Fingerings

The diagram illustrates 14 different fingering patterns for the major scale on a guitar fretboard, arranged in two rows of seven. Each pattern is labeled from 'fingering 1' to 'fingering 14'. The patterns are shown on a 6-string fretboard with finger numbers (1-4) and circled numbers indicating the starting fret. The patterns are arranged in two rows of seven.

SOME ARPEGGIOS ARE NOT USED AS CHORDS

The authentic V-I cadence is the mostly common cadence. Altered versions of the V7 chord have been extensively used in pop, jazz and classical music to dramatize its resolution to the I or Im chord. These alterations commonly involve sharped or flatted fifths and sharped or flatted ninths. Sharped fifth and flatted ninths are not considered acceptable on minor seventh chords. This is our objective reality. If music history had unfolded differently, those alterations may have been acceptable. They probably have been used in film music or obscure classical music, but are not commonplace.

Harmonized major, harmonic minor (a mode of major sharp five), melodic minor and major flat six scales include minor seventh flat five chords. Sharp nine is enharmonically the same as flat three. Though minor modes of the four scales mentioned above include the notes to create a minor chord with a flat nine, that alteration are almost always used only with V type chords. Sharp five occurs with natural three as an augmented triad and as major seventh sharp five or dominant seventh sharp five in some of these scales, but is considered acceptable as an alteration of minor chord. I minor seventh sharp five (Am7#5 is A-C-E#-G) could be re-evaluated with sharp five as the root, making a major add nine chord (E# is f, and F-A-C-G).

ABBREVIATE, ELABORATE OR ALTER CHORD PROGRESSIONS

Abbreviate the Chord Progression

When chords are changing too rapidly for the improviser and listener to comfortably interpret, you should consider substitutes that work for two or more consecutive chords, abbreviating the chord progression.

II V chord progression can be abbreviated all II or all V. See [Interchangeable II and V](#). This principle can be extended to any pair of scale-tone chords with root movement in perfect fourths, as shown in [Abbreviating Chord Pairs](#).

Elaborate the Chord Progression

When chords are changing infrequently enough that the improviser and listener could comfortably interpret more frequent chord changes, you should consider substitutes that replace parts of a chords duration, elaborating the chord progression.

See the chapter "[Abbreviating and Elaborating Chord Progression](#)".

Alter the Modal Basis the Chord Progression

Each chord in a progression has potential substitute chords (or alternates) that include all or many of the same notes. Substitutes may contrast the mood of the original chord by lowering notes chromatically (by an interval of one fret) to darken or (more rarely) may raise notes chromatically (by an interval of one fret) to brighten the mood.

To darken or brighten the mood, change the mode (scale) on which the chords are based. Flat numbered tones to make to make the mood darker or more bluesy. Make numbered tones natural (such as changing b7 to 7) to brighten the mood.

In making a chord a secondary dominant, it is changed major or dominant seventh chord if it was originally minor and changed to dominant seventh if it was originally major, major seventh or major sixth. This usually makes a Mixolydian dominant seventh to progress its root up a fourth to a major chord or a Phrygian major dominant seventh chord (Phrygian with a major third) to progress to a minor chord. See [Secondary Dominant, Modes](#) and [Modes Of Four Heptatonic Scales](#).

4. **Interchangeable II and V**
5. **Flat Five Substitute**
6. **Hidden Roots**
7. **Negative Harmony**

Identify the Parent Major Scale

Beginning with major scale-tone triad pairs, you can identify the parent major scale. Each chord uses some numbered tones of the parent scale. Once enough chord tones have been accumulated to account for each of the seven tones of a parent scale, it is defined.

In terms of the parent major scale, each triad has three consecutive numbers on the tertian cycle. A I major triad is 1-3-5. A II^m triad is 2-4-6, and so on.

Sometimes the parent scale is major sharp five. The system is the same as the parent major scale, but each chord that uses “#5” is changed in quality compared to that chord in an unaltered major scale.

Likewise, a parent major scale with a b3 is sometimes used, called melodic minor ascending form (commonly used the same in ascending or descending but in classical music ascended with b3 and descend with b3, b6 and b7).

In modal terms, the principle of identification is the same. Determine the formula for the mode, such as b3 and b7 for Dorian, then account for every numbered tone.

chord combinations that define a major scale:

Any scale-tone seventh chord and a triad (or seventh chord) built on the next higher scale-tone from the seventh's root.

Three (not two) scale-tone triads or seventh chords in perfect fourths.

Any stepwise pair of triads plus the tone a step below the root of the lower triad.

Any three triads in stepwise or fourth root movement.

unique major scale-tone pairs of triads

major chords with their roots a whole step apart are usually IV to V

minor chord with their roots a whole step apart are usually II_m to III_m

minor up a half step to major is usually III_m to IV major.

V₇ diminished up a half step to major is usually VII dim. to I major.

minor up a fourth to major is usually II_m V

major up an augmented fourth to diminished is IV VII_{dim}

Modal Chord Types

For any scale-tone chord, you need to know its numbered type (I type, V type). See [Number And Letter Cycles](#).

For the I, IV and V chords this is the relative major and relative minor relationship. The traditional relative minor of I is VI_m. Modally, the same relationship occurs for IV type chords with a relative II_m and for V type chords with a relative III_m.

II_m has what could be called a “relative VII diminished”. The “relative diminished” of D_m is B diminished.

SHARED THIRDS: SECONDARY ROOTS

In many cases, a chord can be treated as a different chord which sounds similar but is rooted a chord tone other than the root of the original chord. Chords on secondary roots share the same parent scale as the original chord.

Chords used in jazz usually contain four or more notes and are, by standard practice, built with every other note of a seven tone (heptatonic) scale (see [Number And Letter Cycles](#)). The same cycle of tones, numbered 135624613, etc., is used for any step of the scale to build a chord. See major scale-tone thirds below.

major scale-tone thirds by number and letter

With seventh chords, using four notes in that cycle, a Ima7 chord is 1-3-5-7, a IIm7 chord is 2-4-6-1, a IIIm7 chord is 3-5-7-2, and so on.

Larger ninth chords use five notes in the cycle. Ima9 is 1-3-5-7-2, IIm9 is 2-4-6-1-3, and so on. Ninth chords are only acceptable built on steps I, II, IV, V and VI of the major scale. Those on III and VII are currently considered to have an unacceptable dissonance. Eleventh chords have six notes, constructed in the same every other note pattern. All currently accepted chords can be studied in [All Scale-Tone Chords](#).

Chords of four notes or more have subsets. A ninth chord built on step I is Ima9 and contains 1-3-5-7-2. 1-3-5 is a I major triad. 3-5-7 is a III minor triad. 5-7-2 is a V major triad.

Thirds in All Keys

In each of the three pairs of enharmonic keys C and Db, F# and Gb, B and Cb, the pitches are the same, but given different names.

Secondary Root on The Third

By using the chord type on the third of the original, you will add upper harmony. Whatever the numbered chord type of the original, the secondary root on the third is that two numbers higher in the seven tone cycle. For a five-type chord, (G on V of C major scale) the secondary root would be two scale tones higher and would be a seven-type chord (B diminished on VII of C major scale).

Scale-tone sevenths and ninths on the third of a Ima9 (IIIIm7), IIm9 (IVma9), IVma9 (Vim9), V9 (VIIIm7b5), VIm9 (Ima9), III7b9 (#Vdim7).

Secondary Root on the Sixth

By using the chord type on the sixth of the original, you will cause the original chord to be a sixth. In each case, the chord is a triad with an added scale tone two steps down from the root. I6, for example is scale tones 1-3-5-6. On the sixth of that chord, a subset triad exists, which is 6-1-3 and is the same as a VIm triad. Likewise, a VII diminished triad is built on the sixth of IIm6, a IIm on the sixth of IV6 and a IIIIm on the sixth of V6.

This only occurs with the original on steps I, II IV and V of the major scale, the only modes with a natural sixth. The other major scale modes have a flat six and flat six is not a currently acceptable chord tone, with an “proxy” exception in jazz. In jazz, flat thirteen can be added to a chord name. Though the flat thirteen tone is the same as flat six, the function is to have the flat thirteen as a sharp five (not functionally as a flat six) along with a natural five.

Four major scale-tone seventh chords have a synonym down a minor third. They are: I6 = VIm7, IIm6 = VIIIm7b5, IV6 = IIm7 and V6 = IIIIm7.

The most common applications are: use VIm9 over Ima7, since VIm9 = Ima7/6 and use IIm9 over IVma7, since IIm9 = IVma7/6.

Secondary Root on the Fifth

A secondary root on the fifth of the original adds higher harmony that the secondary root on the third. A triad as a secondary root on the fifth makes a ninth chord version of the original chord.

Playing a seventh chord on the fifth of the original chord can make the original sound like an eleventh. The following types work:

original chord type	type on fifth	eleventh version of original
IIm type	VIm type	IIm11
IV type	I type	IVma9#11
V type	IIm type	V11
VIm type	IIIIm type	VIm11
VIIIdim type	IV type	VIIIm11b5b9

Playing II over V could be thought of as playing on the fifth of the V chord. The first chord of a pair of chords with roots in fourths is often the upper part of a larger second chord:

IIm9 as the upper tones of V13 in a IIm7 V13 chord change (Mister Magic), since the IIm7 is on the fifth of the V7.

VIm9 as the upper tones of IIm13 in a VIm7 IIm7 chord change (the first two chords of Blue Bossa, Footprints), since the VIm7 is on the fifth of the IIm7.

Ima9 as the upper tones of IVma13#11 in a Ima7 IVma7 chord change (Europa, All The Things You Are, Autumn Leaves, Mr. Magic), since the Ima7 is on the fifth of the IVma7.

when the mode provides it, use a sixth-type chord rooted on the fifth

Playing a sixth chord on the fifth of the original chord can make the original sound like a ninth. The sixth chord rooted on the fifth will be a chord synonym of the seventh chord rooted on the third, but will bring different, brighter mooded phrases to mind. The following types work:

original chord type	type on fifth	ninth version of original
I type	V6	Ima9
IV type	I6	IVma9
V type	IIIm6	V9

Secondary Root On The Seventh

Rarely, a secondary root can occur on the seventh. It happens on a suspended thirteenth chord. Bb major seventh (Bb-D-F-A) is the upper part of a C13 sus. 4 chord (C-G-Bb-D-F-A).

DARKENING

Contrasting Moods

We can contrast moods by combining chord types. In blues, we commonly improvise on a major chord with minor content in the same key. Typically, we flat notes to darken moods. When the original mode is substituted with one that flats notes, the mood is darkened.

See [Modes](#), [The Expressive Use Of Modes](#).

Flattening the Seventh, Third or Fifth

We can darken a chord by substituting another chord and its respective mode with one that flats the seventh, third or fifth. If the original chord is a major type, we can flat the seventh and make it a dominant seventh type, based on Mixolydian (named after the chord root). If the original chord is a dominant seventh/Mixolydian, we can flat the third and make it a minor seventh type and Dorian. A minor seventh could be changed from Aeolian type (its mode has b7-b3-b6) or Phrygian type (its mode has b7-b3-b6) to m7b5/Locrian type with b7-b3-b6-b2-b5.

Changing the Key Scale Type

darkening the mood

b3 Dorian over Mixolydian (or over major)

b7 Mixolydian over major

b3 Phrygian over Phrygian major

b7 Aeolian over harmonic minor

b5 Locrian over Phrygian

b5 Dorian b5 over Dorian

b5 Aeolian b5 over Aeolian

b7 Lydian b7 over Lydian

nat. 4 major over Lydian

brightening the mood

nat. 7 harmonic minor over Aeolian (de-emphasize 7)

#4 Lydian over major (de-emphasize 4 in accomp.)

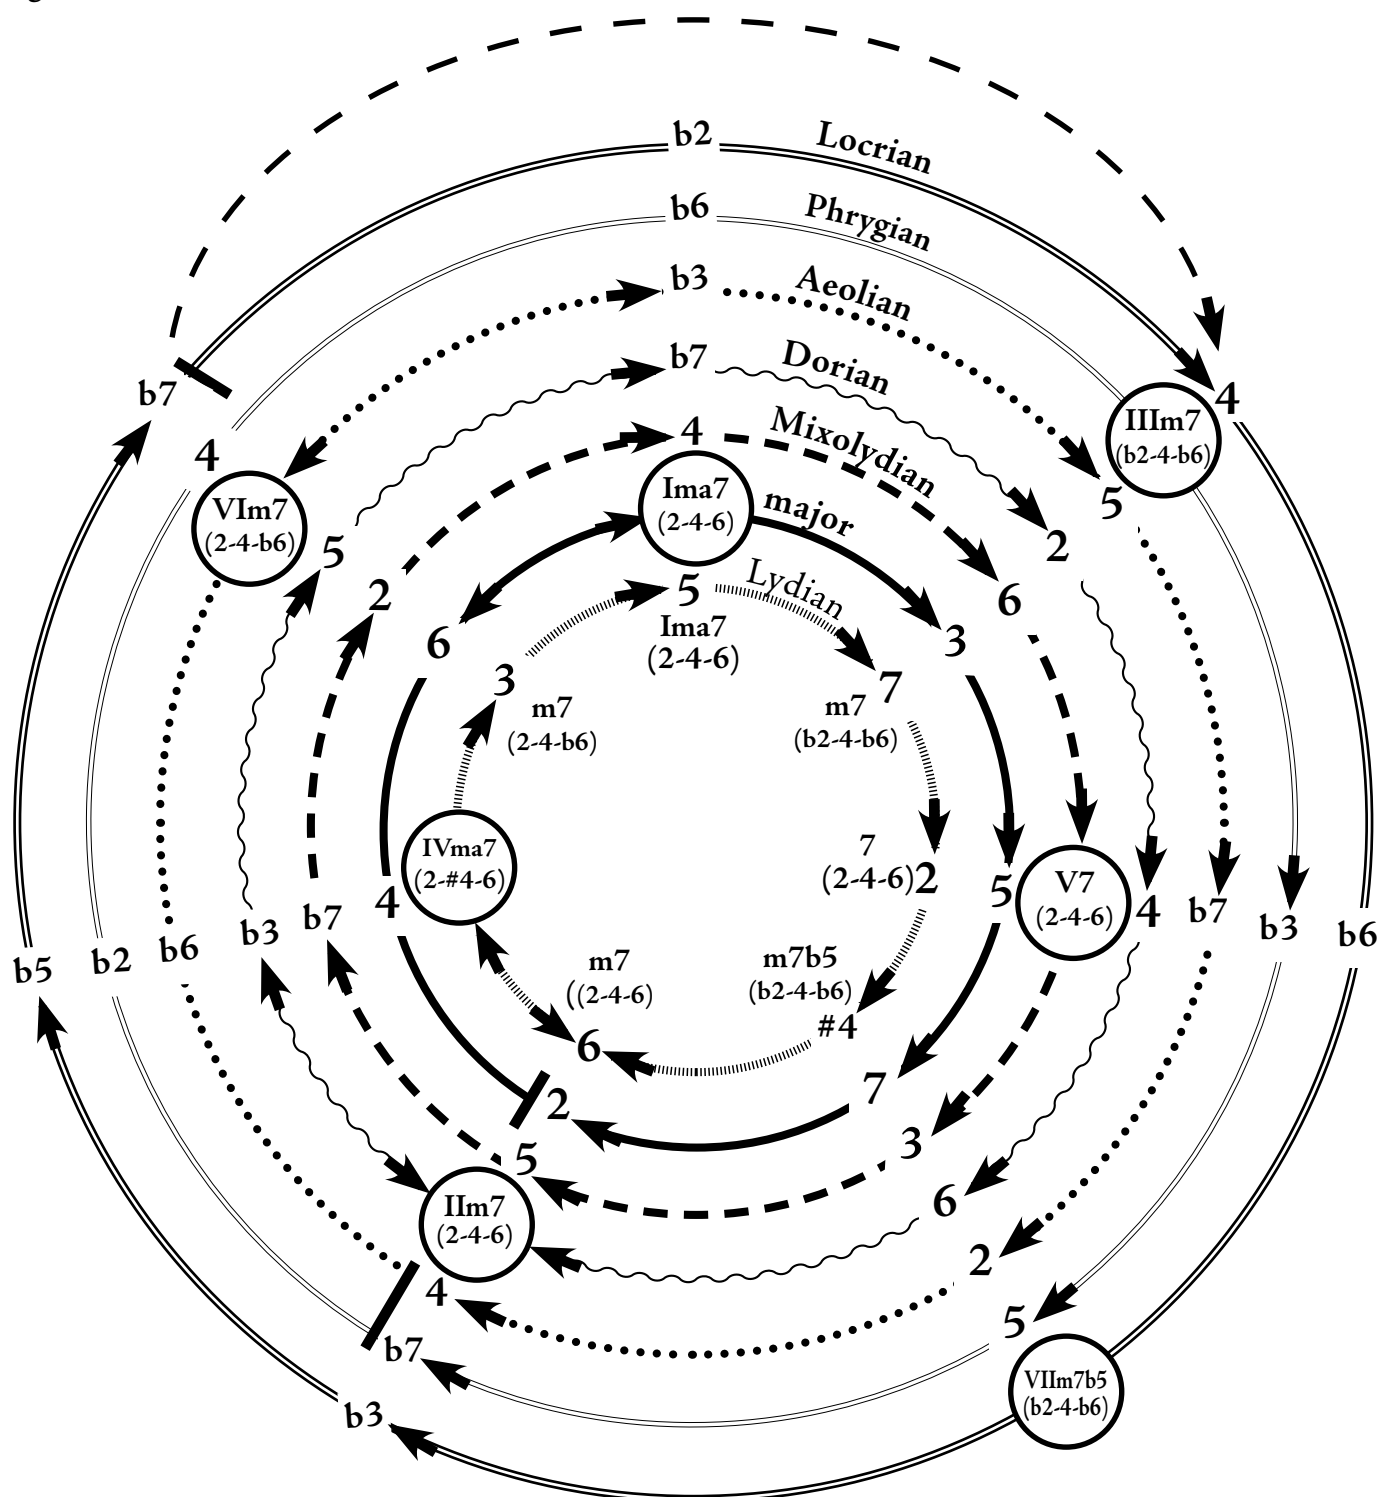

Secondary Roots and Mood Alteration with the Tertian Cycle

We make use of the tertian cycle (cycle of thirds) that the chords are built from to find commonality (synonyms). Each substitute should be conceivable as some version of the chord it replaces, which could be named as a synonym. The note after which the substitute chord is named can be called a *secondary root*.

<u>original</u>	<u>dark original</u>	<u>on six</u>	<u>dark on six</u>	<u>on third</u>	<u>dark on third</u>	<u>fifth</u>	<u>dark on fifth</u>

Modal Substitution Cycles

For the expression of this diagram in chord fingerings, see the chapter “[Modes](#)”/Modal Key Scale Cycle Diagrams.

notable synonyms:

VIm11 = Ima9/add low 6, IIm13 = IVma13#11, bII 13#11 = V7b5#5b9#9

SECONDARY DOMINANTS

Secondary dominants prepare a [target chord](#) by preceding it with the most expected [setup chord](#), the V chord of the target chord. See [Secondary Dominant](#).

INTERCHANGEABLE II AND V

Playing II over V could be thought of as playing on the fifth of the V chord. Playing V over II usually works better by playing a suspended version of the V (emphasize the fourth instead of the third).

Major IIm7 V7

IIm7 is the upper part of V11, rooted on the fifth of V11.

Im9 is the upper part of V13, rooted on the fifth of V13. V13nr n3 = IIm9.

Playing IIm7 over V7 makes the V7 sound suspended and sounds the upper part of V13.

Playing V7 over IIm7 sounds IIm6. V9sus4 = IIm7/11.

Minor IIm7b5 V7 (parent major scale VIIIm7b5 III7).

IIm7b5 = V7b9sus4nr, rooted on the fifth of V13. By playing IIm6b5 (= IIdim7) you sound V7b9.

Playing V7b9 over IIm7 sounds IIm6/11b5 (= IIdim7). V7b9sus4 = IIm7/11b5.

Phrygian b1. bII13#11 = V7b5b9#5#9

Think of the target chord as III of the parent scale during this bII V. The parent scale is melodic minor (major b3), which has Phrygian b1 on its b3. So, the target root is “3” in relation to the parent melodic minor, and is not in the melodic minor scale.

FLAT FIVE SUBSTITUTE

The flat five substitute (also called the *tritone* substitute) is based on the synonym bII7b5 = V7b5 (Db7b5 has the same notes as G7b5). The V chord is replaced with a chord rooted on flat five of the V chord (Db substituted for G in the key of C). The quality of the flat five substitute can be major, dominant seventh (1-3-5-b7) or altered dominant type, including seventh, ninth or thirteenth chords with flat five, sharp five, flat nine and/or sharp nine options. The common II-V-I cadence becomes II-bII-I.

bII7b5 harmonic and melodic structures work on V7b5 (and vice versa) since they are synonyms. This can usually be based on the melodic minor pair IV13#11 and VII7b5#5b9#9. The IV13#11 acts as a bII7 type (optional b5) to progress down a half step. The VII7b5#5b9#9 acts as a V7b5 type to progress up a perfect fourth. See “[Melodically Superimposed Cadences](#)”/Secondary Dominants/Melodic Minor/[The Flat Five Substitute](#) and “[Scale Ambiguity](#)”/Ambiguous Scales for Dominant Chords/[VII super Locrian](#), [IV Lydian dominant](#) and the [flat five substitute](#).

HIDDEN ROOTS

Sometimes the root a chord name indicates is not the actual root implied by the music. Experienced jazz improvisers, arrangers and composers know about these. The accompaniment commonly plays the chord as named, but the improvisers can treat the chord as if it has a different root. This is similar to [secondary roots](#), except the different root is created with an *added* chord tone, whereas in the case of secondary roots, an *existing* chord tone is used as an alternate root.

Examples

Dm7 in One Note Samba Is Bbma9 no root.

IIIIm7 in IIIIm7-VI7-IIIm7-V7 is Ima9 no root.

C#dim7 in Black Orpheus is A7b9 no root.

Diminished Seventh: 7b9 No Root

original dim. 7

C#dim7 VIII

Fdim7 VII

Bb7 VIII

dominant 7 a half step below dim. 7ths root

C7 VIII

F7 VIII

A7 VII

dominant 7 a half step below dim. 7ths b3

A7 VII

Bb7 VII

Eb7 VIII

dominant 7 a half step below dim. 7ths b5

Eb7 VIII

D7 VII

Gb7 VII

dominant 7 a half step below dim. 7ths 6

F#7 VII

G7 VII

C7 VIII

Any one of the seven chords above could be elaborated to seventh flat nine. By raising the root of any of those sevenths by a half step, a seven flat nine no root is made, which has the same notes as the diminished seventh shown at the far left.

reverse-constructing V7b9 no root

When you see a diminished seventh in a tune, see if there is a potential V7b9 root below one of its tones.

Determine what a V7b9 chord for the *next* chord after the diminished seventh chord would be. In Black Orpheus, the next chord after C#dim7 in bar eight is Dm in bar nine. The V7b9 chord in the key of D minor is A7b9. Then consider that 7b9 chord without a root, which is a diminished seventh chord named after either of its remaining notes (its, third, fifth, seventh and flattened ninth). A7b9 no root is a diminished seventh chord with the four synonym names C#dim7, Edim7, Gdim7 and Bbdim7. So the C#dim7 chord could be considered A7b9, no root.

In other songs, the diminished seventh may have a different purpose and is not a V7b9 no root and you won't find the diminished seventh as part of V7b9 of the next chord.

#IVdim7 in bar 6 of jazz blues is IV7b9

C#dim7 in bar 8 of Black Orpheus is A7b9 no root.

C#dim7 in bars 3-4 of How Insensitive is A7b9 no root

Bbdim7 in bar 2 of Wave is A13b9/Bb (D major b6)

Abdim7 in bar 2 of Corcovado is G13b9/Ab

Minor Sixth: Dominant Ninth No Root

Am6 in bar 1 of Corcovado is D9 no root. The A bass note begins a descending chromatic bass line (A-Ab-G).

NEGATIVE HARMONY (DUALISM)

Negative harmony (also called dualism) provides an alternate set of notes and chords to create tension and release with the notes of a diatonic scale such as the major scale. It is a perspective of harmonic music theory that came from science and math studies. It determines an axis half-way between the tonic (C in C major) and the dominant (G in C major). From that axis, for each ascending interval, it mirrors the interval downward. This is calculated with frequency (cycles per second) and is approximated the twelve-tone equal tempermant system that we use.

You don't need to understand the scientific basis of this theory to use it. Use the alternate chords this system provides as alternatives in composition and improv. Test all the negative harmony alternate chords you use. They are much less dependable and predictable than chords build on the major scale and its modes.

If you are interested in the theoretical and scientific basis, here are some resources: *A Theory Of Harmony*-Ernst Levy 1941, *Generalized Musical Intervals and Transformations*-David Lewin 2007. Explore theories of Hugo Riemannian and Neo-Riemannian theories in the Oxford handbook of neo-Riemannian music theories. Search "Negative Harmony on Youtube. You'll find it has been popularized by the amazing Jacob Collier.

negative harmony chords by letter

The tables on the next three pages show negative harmony triads, seventh chords and and ninth chords in all keys by letter. The original major scale-tone chord is in the left of each counn and the negative harmony on the right. To spell each chord, use the circle diagrams at the top of the pages. Triads use three consecutive notes, beginning with the root (letter name of the chord). Seventh chords use four consecutive notes. Ninth chords use five consecutive notes. The circle diagram for each negative harmony chord is more often on a different page from the table.

THE ORDER OF SUBSTITUTION PROCEDURES

1. Ignore brief unimportant chords when practical to do so.
2. Determine the parent scale for each group of chords.
3. Renumber parent scales as key scales (compare to a major scale on the tone center). See [Modes/Key Scale, Parent Scale and Chord Scale](#).
4. Determine the chord scales. Wherever possible, be able to name each as a key scale also.
5. Consider changing chord qualities and their respective key scale types for adjacent chords, preferring to minimize the number of key scale types. Look for and choose key scale types common to consecutive chords.
6. Determine the order of melodic importance (which tones are most important, next most, etc.).

SECONDARY KEYS

Extend Secondary Roots to Tone Centers

Using secondary tonics is an extension of secondary roots. In the order of melodic importance, the chord tones you play using secondary roots are of primary importance and are more strongly emphasized. Think of the three or four note chord built on the secondary root as the main tones. The remaining three or four notes of the mode (scale with specified tone center) in which the chord on the secondary root occurs.

Modal Scales on Secondary Roots Sound Polytonic

By using the appropriate mode on a secondary root, and playing melodic structures and designs in that mode, you tend to suggest a tone center on the secondary root, making the music sound polytonic (with multiple tone centers).

Learn The Modes of Harmonic Minor and Melodic Minor

harmonic minor

The modes of harmonic minor are the same as those on the major scale, but with the fifth sharp and with the tone center on the sixth step of the scale. Conceptually, this can be thought of as the scale *major sharp five*. Each mode of the major scale has one tone altered to produce the harmonic minor/major sharp five mode.

melodic minor

The modes of melodic minor are the same as those on the major scale, but with the third flat. Each mode of the major scale has one tone altered.

modes

Notice the descending sequence of altered tones in harmonic minor and melodic minor.

major scale	major (Ionian)	Dorian	Phrygian	Lydian	Mixolydian	Aeolian	Locrian
harmonic minor	major #5	Dorian #4	Phrygian nat.3	Lydian #2	Mixo. #1	Aeolian nat.7	Locrian #6
melodic minor	major b3	Dorian b2	Phrygian b1	Lydian b7	Mixo. b6	Aeolian b5	Locrian b4

determining secondary tonics

Like secondary roots, secondary tonics can occur on the third, fifth or sixth. Whatever tone of a heptatonic scale the original chord root occurs on, a secondary tonic on the third is up two scale tones, on the fifth up four scale tones and on the sixth, down two scale tones. The numbering “wraps around”, so a tonic near the end of the series of modes continues at the beginning, so the third of Aeolian is major and its fifth is Phrygian.

Expanding the Boundaries with Ambiguity

Beginning around 1960, free jazz musicians including Ornette Coleman, Cecil Taylor, John Coltrane, Larry Coryell and Pharoah Sanders expanded tonality by playing by feel first and used harmonic ambiguity to bridge from traditional harmonic sense into new tonal regions. See the chapters “[Scale Ambiguity](#)” and “[Melodically Superimposed Cadences](#)”.

ABBREVIATING CHORD PAIRS WITH ROOTS IN FOURTHS

Root Movement up in Perfect Fourths

VIm7, Ima7, IIm7, IIIIm7 and V6 (not V7) types can each work on the next scale-tone chord whose root is up a fourth. This works because, in each case the first chord is built on the fifth of the second chord. For example, Am7 is the fifth, flat seventh, ninth and eleventh of Em11. This creates the pairs:

VIm7 + IIm7

Ima7 + IVma7

IIm7 + V7

IIIIm7 + VIm7

V6 + I (without ma7)

With the VIIIm7b5 III7 chord pair (III7, not IIIIm7), it works better to use the III7 over both chords. Doing so downplays the importance of the VIIIm7b5 and suggests that the III7 chord is primary and the VIIIm7b5 is incidental

If you were to use a VIIIm7b5 over a III7, it would attempt the chord sound III7b9sus4 (no root), which is not currently acceptable to most people.

See the chapter "[Abbreviating and Elaborating Chord Progression](#)".

SECONDARY DOMINANT DEFINED

Dominant Defined

In classical music theory, names are used for each step of the major scale.

numbered tone	1	2	3	4	5	6	7
classical name	tonic	super tonic	mediant	subdominant	dominant	submediant	leading tone

In pop and jazz theory, tonic and dominant are used, but the other scale tone names are rarely used. The dominant in any key is on the fifth step of its scale. “G” is the dominant in the key of “C”.

authentic cadence

In a major key, the most common chord progression is the *authentic cadence* from V to I, a chord built on the fifth step of the scale (“G” or “G7” in the key of “C”) progressing to the chord built on the first step (a “C” chord in the key of “C”).

The V Chord In Minor Mimics the V chord in major

To form a stronger, more dramatic chord progression from V (E) to I (Am), Aeolian mode is converted to harmonic minor in order that the minor key V chord is major (1-3-5) or dominant seventh (1-3-6-b7). In A minor, the E minor chord on its fifth step is more often than not changed to E major or E7, making the stronger cadence from E(7) to Am, replacing the weaker Em(7) to Am.

Likewise with the other two common modes used as keys in the major scale, Dorian and Mixolydian, the V chord in each of those modes can be changed to major or dominant seventh to strengthen the progression. The scales in the key of each of the three types of V chords for Aeolian, Dorian and Mixolydian are named after the mode on each respective V chord, as shown below.

Dominant Chords Can Be Built on All Seven Steps of the Major Scale

See Voice Leading Improv with Arpeggio Cadences/Graphically Voice Leading Improv with Arpeggio Cadences/[Scale-Tone Seventh Arpeggios in Perfect Fourths Order, Numbered By Parent Major Scale](#) (includes [secondary dominants](#)).

A [secondary dominant](#) chord mimics the V-I (G or G7 to C in the key of C) relationship by preceding any target chord with a major or seventh chord, on the fifth step of the key of the target chord. For an Am target chord, the secondary dominant is E or E7, chords built on the fifth step in the key of A. For an F chord, the secondary dominant is C or C7, chords built on the fifth step in the key of F. To

emphasize a change of chord quality even farther for a secondary dominant, use more altered tones such as the flat nine, sharp nine and sharp five that are typically used on the V chord in a minor key.

secondary dominants need to use a noticeable change in quality.

Changing a chord to a secondary dominant requires a change in quality to any kind of V type chord, major (1-3-5), augmented (1-3-#5) dominant seventh type (1-3-5-b7) or altered dominant seventh type (1-3-5-b7 with optional b9, #9, b5 and #5). It can also be a ninth, eleventh or thirteenth chord with a major third and a flatted seventh, with optional b9, #9, b5 and #5.

To use a secondary dominant of an F chord in the key of C, change the C major scale tone Cma7 chord (C major scale tone 1-3-5-7, C-E-G-B) to C7 (1-3-5-b7, C-E-G-Bb) by flatting the seventh of the C chord (changing the B note to Bb). This will make the progression stronger, more dramatic and is reminiscent of the authentic cadence in the key of F major, progressing from C7 (V7) to F (I major).

If your target chord is G in the key of C, the secondary dominant could be either D major or D7 (both of which sharp the F of the C major scale. So secondary dominants are based on changing a minor chord to major or dominant seventh or changing a major to a seventh when doing so changes the scale.

See the next section [Scale-Tone Secondary Dominants](#).

THE SECONDARY DOMINANT EXERCISE

Secondary Dominant Cycle Alternating Roots In Thirds and Fourths

This secondary dominant cycle is a repeating pattern following two rules of root movement:

1. Begin with the “I” chord (C). Ascend a scale-tone third from the root of the “I” chord and use that note as the root of a dominant seventh chord. In C, I major would progress to III7.
2. Ascend a perfect fourth and play the major scale-tone triad. III7 would progress to VIIm.
3. The cycle of fourths is 7-3-6-2-5-1-4, where each pair of numbers is a perfect fourth (two and a half steps or five frets). From the end to the beginning of the cycle, four to seven is an augmented fourth, since it is three whole steps or six frets, inclusively. Secondary dominants use perfect fourths, so when you ascend from “IV”, progress to “bVII major”, so it is a perfect fourth.

In the key of C, the secondary dominant cycle is: C-E7-Am-C7-F-A7-Dm-F7-Bb-D7-G-B7-Em-G7, then repeat. For examples of the Secondary Dominant Thirds and Fourths Cycle you can play, see [The Original 1-3-5-8-7 -3-5-8 Example](#), [Comping Design/Secondary Dominant Patterned Arpeggio Exercises](#) and [Open Position Basslines/Roots and Fifths in Basslines/The Secondary Dominant Progression, Roots and Fifths in the Bass](#).

SCALE-TONE SECONDARY DOMINANTS

Roots of Secondary Dominants Progress Up a Fourth

The root of any secondary dominant chord progresses up a perfect fourth (two and a half steps, five semitones or five frets) to the root of the target chord, mimicking major or dominant type progressing up a perfect fourth in the [authentic cadence](#). Examples are given in parenthesis below for the key of C.

Secondary Dominants Based on Major Scale-Tone Chords

list of common secondary dominants and their targets for the key of C major

For each column, play the scale tone chord in the top row of diagrams followed by the target chord in the bottom row., then play the secondary dominant in the second row of diagrams, immediately flowed by the target chord in the bottom row of diagrams. Each pair of chords played in this manner is a V-I type cadence of some kind. You should find the secondary dominant to target cadences stronger than the scale-tone to target cadences.

C major scale-tone secondary dominants

	I (C)	II (D)	III (E)	IV (F)	V (G)	VI (A)	VII (B)
scale-tone chord	Cma7 VIII 1 7 3 5	Dm7 X 1 b7 b3 5	Em7 VII 1 5 b7 b3	Fma7 VIII 1 5 7 3	G7 VIII 1 3 b7 1	Am7 V 1 b7 b3 5	Bm7b5 VII 1 5 b7 b3 b7
secondary dominant	C7 VIII 1 b7 3 5	D7 X 1 b7 3 5	E7 VII 1 5 b7 3 5	F7 VIII 1 5 b7 3 5	already a dominant	A7 V 1 b7 3 5	B7#5#9 VII 1 b7 3 #5 #2
target chord	Fma7 VIII 1 5 7 3	G7 VIII 1 3 b7 1	Am7 VII 1 5 b7 b3	Bb7 VI 5 1 3 b7	Cma7 VIII 1 7 3 5	Dm7 V 1 5 b7 b3	Em7 VII 1 5 b7 b3

the V or V7 chord in major is already a dominant

In the authentic cadence from V (G) or V7 (G7) to I major or Ima7 type (C major or C major seventh type) the V or V7 chord is already a dominant. As mentioned earlier, the [authentic cadence](#) (V to I) is mimicked by all of the secondary dominants.

IIIm7 IIIm7 and VIIm7 chords become dominant seventh

To change the IIIm (or IIIm7), the IIIIm (or IIIIm7) or the VIIm (of VIIm7) into a dominant seventh, the flatted third of each needs to be changed to a natural third. With minor seventh, 1-b3-5-b7 becomes 1-3-5-b7).

IIma7 and IVma7 chords become dominant seventh

I and IV major chords (C and F) already share the major triad quality with the V major chord (G). To signal a change in quality, each of them needs to be changed to dominant seventh to be a secondary dominant. As a secondary dominant, I7 (C7) progresses to any kind of IV chord (F). As a secondary dominant, IV7 (F7) progresses up a perfect fourth to any kind of bVII chord (Bb).

The interval from major scale tone four to seven is an augmented fourth. IV7 can progress up a scale tone fourth (augmented fourth) to VIIIm7b5 chord, but although the voice leading is good, the progression is weak and not dramatic.

Although it is not up a perfect fourth, IV7 is commonly used to progress down a half step to III7. In the IV7 to III7 progression, IV7 could be considered a flat five substitute for VIIIm7b5.

Locrian type dominant (VIIIm7b5)

A seventh modal dominant type is Locrian dominant (using super Locrian), using VII7#5b9 (B7#5b9 in the key of C) to IIIIm or IIIIm7 (Em or Em7 in the key of C). Rather than raising Locrian's flat three to natural three, flat its fourth, so the parent scale is major flat three, commonly called melodic minor. This Locrian b4 scale is called super Locrian.

Major Scale-Tone Seventh Chords In Fourths with Secondary Dominants

The roots of these chords ascending imperfect fourths. In numbers, the cycle is “7-4-6-2-5-1-4”. In letters, the cycle uses those numbered tones of the major scale on which it is applied, using the key signature for the chosen key. The table below shows major scale-tone roots in fourths in all keys. Each key reads left to right in fourths.

	7	3	6	2	5	1	4
C major	B	E	A	D	G	C	F
F major	E	A	D	G	C	F	Bb
Bb major	A	D	G	C	F	Bb	Eb
Eb major	D	G	C	F	Bb	Eb	Ab
Ab major	G	C	F	Bb	Eb	Ab	Db
Db major	C	F	Bb	Eb	Ab	Db	Gb
Gb major	F	Bb	Eb	Ab	Db	Gb	Cb
Cb major	Bb	Eb	Ab	Db	Gb	Cb	Fb
G major	F#	B	E	A	D	G	C
D major	C#	F#	B	E	A	D	G
A major	G#	C#	F#	B	E	A	D
E major	D#	G#	C#	F#	B	E	A
B major	A#	D#	G#	C#	F#	B	E
F# major	E#	A#	D#	G#	C#	F#	B
C# major	B#	E#	A#	D#	G#	C#	F#

C major scale-tone seventh chords and secondary dominants in perfect fourths

Each scale-tone seventh chord is followed by a secondary dominant version. Additional options are shown for the VIIIm7b5 (VII7#5 and VII7b9), IIIIm7 (III7 and III7b9) and V7 (V7, V7#5, V7b9, V7#9). To change the augmented fourth interval from the root of IV to the root of VII to a perfect fourth, “#IV” (#IV7#5) is used as a root for the secondary dominant version of the IV chord.

VIIIm7b5	VII7#5	VII7b9	IIIIm7	III7	III7#5	III7b9
Bm7b5 VI	B7#5 VII	B7b9 VII	Em7 VII	E7 VII	E7#5 VII	E7b9 VI
1 b7 b3 b5	1 b7 3 #5	1 b7 3 5 b2	1 5 b7 b3	1 5 b7 3	1 #5 b7 3	1 3 b7 b2

Voice Leading

major and minor I-VI-II-V

THE FLAT FIVE SUBSTITUTE OF A SECONDARY DOMINANT

Parent Scale IV7-III7-VIm7, the “Authentic Flat Five Substitute”

a flat five substitute of a secondary dominant is bII of V

think of the target key as Aeolian

The relative major of the Aeolian key is the parent major scale.

Phrygian dominant

Phrygian dominant can also be called Phrygian major. The relative major scale for harmonic minor is major sharp five. Conversely, the mode on the sixth step of major sharp five is harmonic minor. The mode on the third step of major sharp five is Phrygian major.

In the Spanish improvisational song Malaguena, Phrygian dominant is the key, not the dominant (V) of a target key.

bII Lydian Dominant versus Lydian major

Relative major flat three is bII Lydian Dominant of V (flat five substitute of V) and is V super Locrian of V.

Melodic Minor Mode Types for Flat Five Substitutes

target	VII	III	VI	II	V	I	IV
bII Lydian dominant of target	I7	IV	bVII	bIII	bVI	bII	bV
mel. min. mode	IV	I	V	II	VI	bIII	VII
key parent scale mel. min. type	Lydian dominant	melodic minor	Mixolydian flat six	Dorian flat two	Aeolian flat five	Phrygian flat one	super Locrian

Be able to think each bII Lydian dominant in terms of the key scale, so you can create theme and variation in melody with a theme in the key scale synonym of the bII Lydian dominant mode and follow with the corresponding content for the mode of the parent major scale for the target. If the target is VIm (Am is VI of the C major parent major scale), use melodic minor V type, Mixolydian flat six (C major flat six).

Memorize the bII Lydian dominant key scale types progressing to a target root down a half step as follows. To calculate the key scale type for each “bII of target” chord, memorize 7-3-6-2-5-1-4 (fourths) and 4-1-5-2-6-3-7. If the target mode is the third number in the 7-3-6-2-5-1-4 series (target VI is Am on the sixth step of the C major parent scale), the key scale mode type for the bII Lydian dominant would be the third number in the 4-1-5-2-6-3-7 series: Mixolydian flat six (C Mixolydian flat six).

GO BY FEELING FIRST

Mood, Rhythmic Style, Story, Tone

In determining the relationships between scales and chords in your music, consider the components of feeling first. The mood, genre, rhythmic style, story and tone will point you in the right direction and are often more important than an exact match of the notes in the current chord and the current scale.

Mis-matching of chord and scale are very frequent in improvisational music. The players involved are not as concerned about the number theory of the music as they are the feeling of the music. The number theory is important, but it is driven by the feeling and can be quite complex. Justifying the various mis-matches of chord and scale according to the sensibilities established in the various styles and sub genres can be very detailed.

When chord progression or rhythm is mis-matched between the accompaniment and the composed or improvised melody, the melody needs to be stated very clearly. When Charlie Parker would play a different chord progression in his melody from the accompaniment, he would state the chord progression very clearly, usually by playing up or down the arpeggio for each chord (more often descending the arpeggios). When Pat Martino played sixteenth notes against a swing eighth accompaniment, as on All Blues, he played continuous sixteenths (as he too often does), allowing the listener to comprehend the three divisions per beat in the accompaniment (the first and third of three parts per beat makes regular swing eighths) and four divisions per beat in his improvised melody.

When scales are used ambiguously, they can provide different versions of each numbered scale tone, allowing a flat or natural six, a flat or natural third, and so on. This can give us more flexibility in color. Arnold Schoenberg's twelve tone row method of composition (also called serialism) advocated using all twelve notes equally as often in a composition, while not giving any one of them more strength, avoiding tonality. The emphasis of a particular note creates a tonal key and the lack of emphasis of a particular note is atonality (the absence of a key).

Personally, I can appreciate serialism in a film score or background music in a museum, but in playing music I prefer a key and don't like the game-like rule of *having* to use all twelve chromatic tones.

FLEXIBLE SCALE-CHORD MATCHING

In the older traditions, melody is made up with the same scales should that make up the chords in the accompaniment. In modern improvisation, the matching of a chord type (and mood suggested) by a single note melody and by the accompaniment behind it is flexible. It is typical in blues-based styles (rock, jazz, funk, reggae, etc.) that the composed or improvised melody darkens the mood by flattening thirds, fifths or sevenths. The accompaniment chords can also darken the mood by flattening thirds, fifths or sevenths.

If, for example, you are improvising a melody against a C chord with a sharp nine (sharp two) , such as C7#9, your melody could still use “nine” (two), as long as the mis-matched nine and flat nine are not played too prominently for too long a duration. The disagreement needs to be subtle, not “in your face”. The duration of mis-matched notes is an issue of time in seconds, not beats. Two beats at sixty beats a minute is two seconds, while two beats at 240 beats a minute is half of a second.

If three transcribers were given the notation to a sophisticated jazz improvised solo *without* the chord names, it is likely each of them would have a different take on what chords are suggested, yet all the interpretations of all three may be valid. If you then look at the chords actually used in the accompaniment, they are likely to be another version again. Furthermore, in each time the musicians play through the chord progression, the chords suggested by the improviser and the chords played by the accompanists are likely to differ. Even within the same section of the song, two musicians may play different, but compatible versions of the chords.

I’m calling the flexibility of scale-chord matching *ambiguity*. Each chord and scale has optional types within its category. The broadest categories are major, minor and dominant.

AMBIGUOUS SCALE CATEGORIES

General Chord Ambiguity

Smaller chords, such as triads, have more options of scale types. When using a seven-tone scale with triads you have many options for the remaining four tones of the scale.

In the [Modal Key Scales](#) section of the [Key Scales](#) chapter you'll find seventh chords listed in all the common modes with parenthesis after most of them, showing three optional added tones.

On the [Largest Tertian Chords In 28 Modes](#) table in the [Key Scales](#) chapter, each thirteenth chord has the same seven notes as the scale it is constructed from. You can use those thirteenth chords with the exactly matching scale from which each of them were made or choose options that change the mood, usually choosing an alternate mode with a flatted seventh, flatted third or flatted fifth (or combinations of them).

Target Chord Ambiguity

Tonality is a focal point on a particular note that is the implied bass note of the chord the listener would expect a piece of music to end on to sound complete. The implied ending chord is called the *tonic chord*. Music doesn't always end with a resolution to the implied tonality. It may end with a deceptive cadence, to intentionally leave the listener with a feeling of incompleteness.

A target chord is any chord that establishes a tonality, whether the tonality is for the entire section or for a part of it. Target chords are preceded with setup chords in the accompaniment or by setup chords implied by the melody. One or more setup chords may form a chord progression that strengthens the tonality of the target chord. The group of setup chords, together with the target chord are called a cadence. Cadences are usually auditorily familiar to the listener and recall similar situations in previously heard music where a tonality was established for a target chord.

Target chords can be major, minor or dominant types. See the chapters [Modes](#) and [Key Scales](#).

Major target chords are most commonly Ionian (major scale) or Mixolydian. Mixolydian is a dominant type. It was first used as a mode for the V chord, but in the last hundred years or so is used as a key major target chord type (I type) with the introduction of blues in popular music.

Minor target chords are traditionally Aeolian, but are commonly Dorian also.

Setup Chord Ambiguity

A setup chord leads to a target chord. Most commonly, the setup chord is a V chord, with its root on the fifth step of the key. We will look at eight types of V chords in this chapter. See [Ambiguous Scales For Dominant Chords](#). The eight types of V chords discussed here are Mixolydian, Lydian dominant (Mixolydian flat seven), Mixolydian flat six (Aeolian major), Phrygian major, Phrygian minor/major (Phrygian with both flat three and natural three), super Phrygian, super Locrian and half/whole diminished scale.

As stated in the beginning of this chapter, go by feeling first. Your sensibilities should tell you that moods match better when you stay the the same harmonic family. See [The Four Harmonic Families](#) in the chapter [Phrases Built With Core Melody, Cell Elaboration And Filler](#).

AMBIGUOUS SCALES FOR MAJOR CHORDS

Major Keys Are Commonly Ionian or Mixolydian

Most of the time, major target chords (major key chords) are Ionian (major scale) or Mixolydian (major scale with flat seven). However, there are many other options:

- modes I, IV and V of major scale
- modes II and IV of major sharp five (equivalent to V and bVI of harmonic minor)
- modes IV and IV of melodic minor
- modes I and V of harmonic major

See [Modes Of Four Heptatonic Scales](#) in the [Modes](#) chapter.

Darkening and Brightening

In the order from having a sharped fourth, to a natural fourth, to flatting the seventh and flatting the third, the mood can be darkened. Here are some examples, from bright to dark:

- #4 - Lydian and Lydian dominant are brighter (maybe a little blindingly) than Ionian (major scale)
- natural 4 - Ionian (major scale) is the most common major key scale chord
- natural 4, flat seven - Mixolydian provides the blues sound
- natural 4, flat seven, flat three - Dorian provides a very bluesy sound, usually as a brief alternative to Mixolydian during a major chord

Exotic Major Modes

- #4 - Lydian and Lydian dominant are brighter (maybe a little blindingly) than Ionian (major scale)
- b2-b6-b7 - Phrygian major sounds Spanish, flamenco, gypsy and north African
- b2-b3-natural 3-b7 - super Phrygian is a good-sounding exotic alternative to Phrygian major

AMBIGUOUS SCALES FOR MINOR CHORDS

Minor Keys Are Commonly Aeolian or Dorian

Most of the time, minor target chords (major key chords) are Aeolian (major scale with flat three, six and seven) or Dorian (major scale with flat three and seven). Aeolian is more common and has been established longer in music repertoire.

Dorian can be created by flattening the third and seventh of a major scale, or by establishing the tone center on the second step of a different major scale. D Dorian is a D major scale with flat three and flat seven. D major scale is D-E-F#-G-A-B-C#-D. With D major's third and seventh flat, it becomes D Dorian: D-E-F-G-A-B-C-D. The C major scale is C-D-E-F-G-A-B-C. Establishing the second step of a C major scale as a tone center by, for example, playing the C major scale from D to D also produces the D Dorian mode: D-E-F-G-A-B-C-D.

Aeolian can be created by flattening the third, sixth and seventh of a major scale, or by establishing the tone center on the sixth step of a different major scale. A Aeolian is an A major scale with flat three, flat six and flat seven. A major scale is A-B-C#-D-E-F#-G#-A. With A major's third, sixth and seventh flat, it becomes A Aeolian: A-B-C-D-E-F-G-A. The C major scale is C-D-E-F-G-A-B-C. Establishing the sixth step of a C major scale as a tone center by, for example, playing the C major scale from A to A also produces the A Aeolian mode: A-B-C-D-E-F-G-A.

See [Modes Of Four Heptatonic Scales](#) in the [Modes](#) chapter.

Harmonic Minor

Aeolian is often substituted by harmonic minor, which has flat three and six, but not flat seven. This change causes the chord built on the fifth step of the Aeolian mode to be major, rather than minor. The strongest two-chord progression that establishes a minor key (a two-chord cadence) is Vm(Gm) to Im (Cm), such as Gm to Cm in C minor. G major to Cm is even stronger, hence the name of the scale that produces it *harmonic minor* (harmonic refers to harmony or chords).

Darkening and Brightening

In the order from having the altered tones b7-b3, to b7-b3-b6, to b7-b3-b6-b2, the mood can be darkened. This uses the accumulating flatted tones 7, 3, 6, 2, which are in perfect fourths. Each tone b7 to b3 to b6 to b2 is a perfect fourth (an interval of five frets) from the next. Here are some examples, from bright to dark:

- b7-b3 is Dorian, with the brightest (happiest) mood of the minor modes
- b7-b3-b6 is Aeolian, major scale mode VI, the most traditional mode
- b7-b3-b6-b2 is Phrygian, major scale mode III, the darkest minor chord mode derived from the major scale

Exotic Minor Modes

Melodic minor in classical music traditionally ascends as a major scale with a flat three (1-2-b3-4-5-6-7) and descends as Aeolian (1-b7-b6-b5-5-b3-2-1). It is used in Bach's Bouree in Em and in the Beatles song "Yesterday". In jazz, the melodic minor scale is usually used ascending and descending as a major scale with flat three.

Dorian sharp four (1-2-b3-#4-5-6-b7) on the fourth step of harmonic minor can elaborate a diminished seventh sound on its tone center. See [Modes Of Four Heptatonic Scales](#) in the [Modes](#) chapter. Diminished seventh is 1-b3-b5-6 (bb7). Dorian sharp four has those tones by using its #4 as a b5, which is the same note.

Dorian flat five (1-2-b3-4-b5-6-b7) can be used to darken Dorian, making it bluesy. It occurs on the second step of harmonic major (major flat six). See [Modes Of Four Heptatonic Scales](#). The basis of this mode is a diminished triad, since it has 1-b3-b5. Like Dorian sharp four, it can elaborate a diminished seventh sound on its tone center, but is darker, since Dorian flat five has no fifth.

Aeolian flat five (1-2-b3-4-b5-b6-b7) can make Aeolian bluesy. It occurs on the sixth step of melodic minor. See [Modes Of Four Heptatonic Scales](#).

Dorian flat two (1-b2-b3-4-5-6-b7) can make a I minor six chord in Dorian mode more exotic. It occurs on the second step of melodic minor. See [Modes Of Four Heptatonic Scales](#).

Super Phrygian (1-b2-b3-b4-5-b6-b7) can establish a tone a half step above its flatted third as a "flat four", rather than the natural three usually implied by the flat four (flat four is the same note as natural three). Super Phrygian occurs on the third step of harmonic major. See [Modes Of Four Heptatonic Scales](#).

AMBIGUOUS SCALES FOR DOMINANT CHORDS

“Stand-Alone” Keys

Any of these scales can be used as a V type scale with a target “I” chord in mind or as a “stand-alone” scale where you are playing in the key of the chord root.

Dominant Chords Are “V Type”

In classical music theory, “dominant” refers to the fifth step of a major scale. The four-note chord on that step is a dominant seventh chord, with the key tones 5-7-2-4 (G-B-D-F in the key of C) and formula from its root 1-3-5-b7 (numbered tones in the the key on “5” of C). There are many variants of this dominant chord with alterations of the chord type and a chord with an alternate root called a [flat five substitute](#) (or tritone substitute). The [flat five substitute](#) uses an alternate root which is a flatted fifth from the V of the key. If the key is “C”, the fifth would be “G”. The flatted fifth of “G” is “Db”, which is bII of the target key chord, “C”.

The Lydian Family of V Type Scales

The Lydian family of scales includes the altered scales Lydian dominant, its [flat five substitute](#), super Locrian and Dorian sharp four (Lydian dominant flat three). These scales can also be ambiguous combined with diminished half whole scale. Lydian dominant has sharp four and flat seven. It can be conceived as Lydian (sharp four) with a flat seven, or as Mixolydian (flat seven) with sharp four. Lydian dominant occurs on the fourth step of melodic minor. On the seventh step of melodic minor, super Locrian occurs, which is commonly used as a [flat five substitute](#) for Lydian dominant. See Substitution/[Flat Five Substitute](#).

The Phrygian Family of V Type Scales

The Phrygian family of scales includes Phrygian, Phrygian major, super Phrygian and the Phrygian minor/major hybrid. Phrygian (minor) has b2-b3-b6-b7. Phrygian major has b2-b6-b7 (natural three). Super Phrygian has b2-b3-b4 (same as natural three), flat six and flat seven. Like the Lydian dominant/diminished hybrid, the Phrygian major/minor hybrid uses Phrygian major in the low range of pitch with natural three and Phrygian minor (the original Phrygian mode) in the high range of pitch with flat three.

Compare Altered Dominants with Altered Ninths

Phrygian major

Phrygian major is a seven tone scale build on the third step of harmonic minor. Its formula is 1-b2-3-4-5-b6-b7. It is the common scale used in a minor key for the V7 chord. Its flat two can be used as a flat nine in a dominant seventh chord. Its flat six can be used as a sharp five in a chord. Lowering both the 3 and 4 of super Locrian each a half step changes it to super Phrygian.

super Phrygian

Super Phrygian (my term) is a seven note scale built on the third step of harmonic minor (Aeolian natural seven). Its formula is 1-b2-b3-3 (b4)-5-b6-b7. The flat two can be used as a flat nine in a chord. Its flat three can be used as a sharp nine in a chord. Its flat six can be used as a sharped fifth in a chord.

It has a I minor *and* a bII minor chord, so there are tones a half step above its tonic I minor chord. It could be summarized as a I minor seventh chord with a half step above its root, flatted third and fifth.

Flatting the fifth of super Phrygian changes it to super Locrian. Raising both the b3 and b4 of super Phrygian each a half step changes it to Phrygian major. Adding four to super Phrygian changes it to Phrygian major/minor. Changing the five of super Phrygian to flat five changes it to super Locrian.

Phrygian major/minor

Its formula is 1-b2-b3-3-4-5-b6-b7. Phrygian major/minor can be used with Phrygian major (Phrygian dominant) in the low octave and Phrygian minor in the high octave. Its flat two is a b9 in a chord, its flat three a #9 and its flat six can be a sharp five in a chord.

Phrygian major/minor can also be used in it's combined form in the same octave, with precautions. Phrygian major/minor is an eight note scale that contains all the notes of Phrygian (b2, b3, b6, b7), but also has a major third (3), as in Phrygian major. Melodically, the scale would typically ascend or descend to "seven" without passing it. Phrygian major/minor uses Phrygian major (Phrygian dominant) in the low octave and Phrygian minor in the high octave. Omitting the four changes Phrygian major/minor to super Phrygian.

super Locrian

Super Locrian (seven notes) is 1-b2-b3-3(b4)-b5-b6-b7. It could be called the "flat all" scale, since it has every numbered tone of a major scale flatted except "1". Super Locrian is built on the seventh step of melodic minor (major flat three). Making the five natural in super Locrian changes it to super Phrygian.

VII super Locrian , IV Lydian dominant and the **flat five substitute**

A harmonized scale is a chord that uses all of the notes of a scale, usually in thirds. Super Locrian is mode VII of melodic minor (major scale flat three). The harmonized scale for super Locrian is VII#5b5#9b9 (B7#5b5#9b9). Since it uses all seven steps of the scale, it has the same notes as mode IV of melodic minor, Lydian dominant. The harmonized scale for Lydian dominant is the chord 13#11.

The **flat five substitute** practice involves freely substituting parts of super Locrian VII#5b5#9b9 (B7#5b5#9b9) and Lydian dominant 13#11 (F13#11) for one another.

The target chord is III. Using the **Escherian type of deceptive cadence**, the target III chord could be any chord with a perfect fifth. See **Melodically Superimposed Cadences/Escherian Cadence**. To illustrate

this, practice using the super Locrian/Lydian dominant hybrid arpeggio on the [Scales for 7#5#9](#) page. It ascends from the bass with the root, third, sharpened fifth and flatted seventh of a dominant VII type chord (B7#5 in the key of C). The tone that is the flatted seventh then is treated as the third of IV13#11 and you ascend that arpeggio as far as range permits. Then you would resolve to a III chord (E), of whatever quality you need, as long as it has a perfect fifth. This shows the essence of the [flat five substitute](#).

Phrygian major, super Phrygian and super Locrian related to relative major

Consider the altered V chord (G7 altered) you are using as a V in a minor key (C minor). The relative major scale of the minor key (Eb major scale is the relative major of C minor) can be altered each of three different simple ways to produce V Phrygian major, V super Phrygian and V super Locrian.

- Sharp the five of the relative major scale (Eb) to produce V (G) Phrygian major (C minor target).
- Flat the six of the relative major scale (Eb) to produce V (G) super Phrygian (C minor target).
- Flat the six and the seven of the relative major scale (Eb) to produce V (G) super Locrian (C minor target).

Diminished Half/Whole Scale and Related Scales

the numbers on the diagrams below are finger numbers

See also Half-Whole-Half Cells and Diminished Scale/[Perfect Fourths Moving in Minor Thirds](#).

Diminished half-whole scale, an eight-note scale, is a couple of modifications away from Mixolydian (a major scale with a flatted seven). Lydian dominant scale is Mixolydian with a sharpened fourth (1-2-3-#4-5-b7). Taking that one modification farther, replace the “2” in Lydian dominant with both “b2” and “#2” and you have diminished half-whole scale.

Both diminished half/whole scale and Mixolydian flat two have a natural six, unlike the Phrygian family and Locrian. Both are well-suited for 13b9 chords (usually voiced without an eleventh).

Super Locrian has flat five and flat six (enharmonically the same as sharp five), while diminished half-whole scale has five and six. Diminished scale also has “#11” (#4) which can proxy (substitute for) as flat five. Use the range from three to flat seven in super Locrian for a wacky whole tone sound. Replacing

the flat six in super Locrian with both five and six changes it to diminished half-whole scale. Conversely, replacing both the five and six of diminished half-whole scale with flat six, changes it to super Locrian.

Augmented Arpeggio Fingerings

Augmented arpeggios are an important part of altered dominant chords with a sharp five. See [Scales for 7#5#9 and 7#5b9](#), where the augmented part of each arpeggio is shown on black. Augmented arpeggios are a serial pattern, a repeating interval pattern of major thirds. Any note in an augmented arpeggio can be the root. For any given position, the three fingerings below can represent augmented arpeggios in all keys. The numbers on the diagrams below are finger numbers.

Compare Altered Dominants with Natural Nine

Mixolydian has a flatted seventh. Lydian dominant (Mixolydian sharp four) has a flatted seventh and a sharped four. Mixolydian flat six is the mode on the fifth step of melodic minor. Dorian sharp four is harmonic minor mode IV.

The Lydian dominant/Dorian sharp four hybrid is especially effective using Dorian sharp four from one up to flat three and using Lydian dominant from one down to three.

Dominants with natural nine share tones 1-2-3-b7 ("2" implies "9" in the high octave). Those tones are shown in the gray columns below. Dominants with natural nine differ in their fifth. The black columns below show the three versions of the fifth in a dominant ninth chord: flat five, natural five or sharp five. Those with sharp five include an augmented triad. See [augmented arpeggio fingerings](#).

The Many Chords of Diminished Half/Whole Scale

Fingering

the numbers on the diagrams below are finger numbers

diminished seventh arpeggio

diminished scale

The Harmonized Diminished Scale

The harmonized diminished half/whole scale is 13b9#9#11, meaning if you played all the notes at once, you would produce that chord. You can't play the entire chord on a six or seven string guitar, since it has eight notes.

The Diminished Scale is a Serial Pattern

The diminished scale constitutes two diminished seventh chords with their roots a half step apart, such as C dim 7 and Db dim 7. The notes of C dim7 can be spaced equally in minor thirds (three fret intervals). This divides the octave of twelve chromatic tones into four equal minor third intervals, so either of the four notes in C dim7 can be a root. Therefore, C dim7 has three chord synonyms: Eb dim7, F# dim7 (=Gb dim7) and A dim7.

The group of notes that are a half step above each tone in C dim7 make up Db dim7. As with any diminished seventh chord, the notes of Db dim7 can be spaced equally in minor thirds. This divides the octave of twelve chromatic tones into four equal minor third intervals, so either of the four notes in Db dim7 can be a root. Therefore, Db dim7 has three chord synonyms: E dim7, G dim7 and A dim7.

Since the diminished scale is a serial (repeating) pattern that produces the same relative notes every minor third, it can be named after any of the four notes within it that each ascend a half step to the next note. If you named the scale and its harmonized chord after "C", it would have the scale-tone letter names C-Db-Eb-E-F#-G-A-Bb-C (1-b2-b3-3-#4-5-6-b7-1 in numbers) and would have the harmonized chord name C13b9#9#11. The same notes could be used to construct Eb13b9#9#11, F#13b9#9#11 (Gb13b9#9#11) or A13b9#9#11. In each case, alternate enharmonic names could be used to more accurately depict the 1-b2-b3-3-#4-5-6-b7-1 formula in relation to the major scale of the chord root

There are a great number of subset chords you can play on a six string guitar, that fall in two broad categories, 7b9 and m6b5. Minor sixth flat five is an alternate name for diminished seventh, a more relevant name in the manner we will use it.

the diminished seventh on b2, 3, 5, b7

The first category is based on 7b9, whose predominant is 7b9 no root, a diminished seventh chord that can be named after any note in the 7b9 chord except the root. The 7b9 chord on the tone center of the diminished scale has tones 1-3-5-b7-b2 (b2 is the same as b9), which can be reordered to 1-b2-3-5-b7. Without a root the remaining notes make a diminished seventh which can be named after the notes on b2, 3, 5 or b7 of the diminished scale. For a C diminished half whole scale, C7b9 can be built on its tone center, using a series of five notes in thirds. Without the C root, the remaining notes make Db dim7, E dim7, G dim7 or Bb dim7, which each have the same notes: E, G, Bb Db.

You can read about using the 7b9 chord in these sections of [Prime Scales, Chords and Arpeggios: \]Arpeggios And Their Scales/Diminished Seventh Arpeggio And Diminished Scale/Using V diminished half-whole scale as V7b9.](#)

the minor sixth flat five on the diminished half whole scales' tone center

Minor sixth flat five is another way to name diminished seventh. I prefer the m6b5 name to express the use of the flat third implied by "minor" and the flatted fifth and sixth expressed literally in the name. The Goodman/Christian melodic style described in [Prime Scales, Chords and Arpeggios/Arpeggios And Their Scales/Diminished Seventh Arpeggio And Diminished Scale/Using Diminished Half-Whole Scale as a Goodman-Christian Im6b5.](#)

Chords Built with Diminished Half Whole Scale

how to apply these chords

Each of these chords can be melodically elaborated with diminished half/whole scale on "1" in relation the the chord. Keep referring back to "[fingering](#)" at the beginning of this section. The abbreviations F1&2, F1&2 or F2&3 refer to the fingering names shown for diminished scale: "fingerings 1 & 3", "fingerings 1 & 2" and "fingerings 2 & 3".

in this section, 1-b3-b5-6 are grey, b2-3-5-b7 are black

In this "Chord Built With Diminished Half Whole Scale" section, the tones of the Goodman/Christian m6b5 (diminished seventh, 1-b3-b5-6) are grey and the tones of the 7b9 no root chord (diminished seventh with b2-3-5-b7) are black.

chords built with diminished half/whole scale

Chords built with diminished half whole scale include (all would have a "C" root for C diminished half/whole scale): major, minor, diminished, 7, 7b5, 7/#11, 7b5b9, 7b5#9, 7b9#11, 7#9#11, 7b5b9#9, 7b9#9#11, 13b9, 13#9, 13#11 (no 9).

Diminished Scale Fingering and Improv

In a diminished scale, learn to repeat groups of two to four notes (or more) with fixed intervals that are part of the diminished scale up or down in minor thirds and diminished fifths. Avoid repeating at intervals that would cause a redundancy where the last note of one group is the same as the first note of the next group.

Note that for each lower-pitched tone in a chromatic pair of notes in the diminished scale, there is a note a perfect fourth below it. Conversely, for each higher-pitched tone in chromatic pairs in the dim. scale, there is a note a perfect fourth above it.

There are only three diminished seventh chords: A-C-Eb-F#, B-DF-G# and E-G-Bb-C#. Due to the symmetrical structure of the diminished scale, once you determine whether a particular note is the upper or lower note in a chromatic pair, a melodic cell played in relation to it can be played with exactly the same relative intervals, “rubber stamped” in relation to any other note in the diminished seventh chord of which it is a part. Such melodic cells can be repeated up or down in minor thirds or in diminished fifths.

The notes of a diminished scale make the chord 13#11b9#9. The lower tone in a chromatic pair within the diminished scale is part of the diminished seventh named after the root of the 13#11b9#9 chord (C diminished seventh for C13#11b9#9). The upper tone in a chromatic pair within the diminished scale is part of the diminished seventh chord built on b2, 4, b6, or 7 of the 13#11b9#9 chord, which is 7b9 no root in relation to the C13b9#9 chord.

Learn to play both in-position diminished scale (three fingerings) and the four-note-per string fingering with the diagonal movement from string to string and one fret extra between the third and second string.

For fast sequences of pairs of fourths moving in diminished fifths on the three bass strings, use only the index and middle finger. Descend reaching a minor third (a three-fret interval inclusively) on the same string toward the head of the guitar with the index finger, followed by a perfect fourth to the same fret of the next larger string. Ascend reaching a minor third toward on the same string toward the body of the guitar, followed by a perfect fourth to the same fret of the next smaller string.

Make up cells with a combination of pairs of notes in fourths up or down in minor thirds, pairs of chromatic notes in diminished fifths or various four-note cells up or down in minor thirds or diminished fifths. Use one of the four notes in the cell as a point of reference and graphically track the set of first notes in minor thirds or diminished fifths. Learn the skewed pattern for minor thirds or diminished fifths that happens between the third and second string because of the change in tuning on those strings.

For memorized four-note cells, use a diminished scale fingering on the three small strings and descend in diminished fifths or minor thirds on the four bass strings (conceptual overlap) in relation to the first note of the four-note cell.

Ambiguously establish a blues style with both minor 7/#11 pentatonic (minor pentatonic with a sharp four) and major 6#9 pentatonic (major pentatonic with a sharp two used "on top" as a sharp nine.

V Lydian Dominant and V Diminished Half/Whole Scale

Establish the ninth with Lydian Dominant, then transition to diminished half whole scale, replacing the ninth with both flat nine and sharp nine (b2, #2). The accompaniment may use alter ninths throughout, as long as the disagreement is not too prominent. This breaks a time-honored rule in jazz and blues where a chord's minor third in the accompaniment shouldn't be combined with a major third in the melody. Justify it by establishing the accompaniment chord darkening the chord sound, rather than the usual darkening in the melody.

Blues Ambiguity with Altered V Diminished Half/Whole

Let's break a rule. It's been established that when three are alternated in sequence, we should end on natural three. Paul McCartney successfully broke this rule in his outro solo on "Ticket To Ride". With all eighth or sixteenth notes, play the ascending sequence of notes "6-b7-3", followed by "b3" (#2 or sharp nine). It sounds sort of like a spy theme, like Mission Impossible or part of a James Bond score. Similarly, use diminished scale compositionally and get acquainted with its cool, odd sound.

IMPROVISING ON CHICK COREA'S SPAIN SOLO SECTION

The ingenious solo section chords in Chick Corea's *Spain* is a great chord progression with which to study altered dominant chords to build your ability to use them ambiguously. Here is the chord progression:

Gma7	Gma7	F#7	F#7	Em7	A7b9
Dma7	Gma7	C#7	F#7	Bm	B7

Use a Single Parent Major Scale as a Basis

Our primary task is going to be learning four scale types that each alter a note or two of the D major scale. G Lydian dominant is D major flat three. F# Phrygian major is D major sharp five and F# super Phrygian is D major flat six.

You will be managing a lot of scale fingerings, arpeggios and melodic ideas using them. Start practicing on one chord at a time, with a single scale and gradually learn to play on longer chord progressions with progressively more scales. Break the scales for V type chords into two categories: the [Lydian Family](#) and the [Phrygian family](#).

treat Dma7, Gma7, Em7 and Bm as D major scale-tone chords

On those chords, use the D major scale, but tend to establish Bm as the tonic chord. The progression is ambiguous, establishing the key of D in bar seven and its relative minor, the key of Bm in bar eleven.

use a pentatonic key scale basis in B Aeolian minor and D Ionian major

Using the We will be establishing the key as either mode VI of D major, which is B Aeolian or as mode I of D major, which is D Ionian (D major scale). You may know that there are three favored fingerings for the common major and minor pentatonic scales. Our use of the D major parent scale will use those three fingerings, as shown below (see Pentatonic Fingering/7 Pentatonic Scale Types By Octave Shape/[Learn These Six Pairs First](#)).

Treatments Of The V chord (F#7) In Bars Three, Four and Ten

Gma7 Gma7 F#7 F#7 Em7 A7b9
 Dma7 Gma7 C#7 F#7 Bm B7

V Super Locrian and V diminished half whole featuring b5 of V (F#)

Super Locrian and diminished half-whole scale both contain flat five. These chords and arpeggios can be used during F#7 or C7 (each with optional altered tones) as a setup to a target chord with the root “B”. The scale choices show ambiguities. The target chord could be B I type (Bma7, B6), B V type (B7, B9) or B VI type (Bm, Bm7).

root on V →	F#7b5 V	F#7b5 VII	F#7b5b9 VIII	F#7b5#9 VIII		F#7b5 XI	F#7b5 XIII

root on V →		F#7#5#9 XIII	F#(7)#5#9 X	F#7#5#9 XIII			
flat five substitute for V (F#) is bII (C)		C13#9 XIII	C13#11 X	C13#11 XIII			

C# super Locrian, the flat five substitute of G Lydian dominant

Gma7	Gma7	F#7	F#7	Em7	A7b9
Dma7	Gma7	C#7	F#7	Bm	B7

G7 is part of G Lydian dominant, the mode on the fourth step of D melodic minor (D major flat three). The seven-note thirteenth chord in G Lydian dominant is G13#11. The **flat five substitute** for G7 (G Lydian dominant) is C#7 altered (any combination of flat five, sharp five, flat nine and sharp nine, but no natural five nor natural nine). C#7 altered is part of super Locrian mode on the seventh step of D melodic minor (D major flat three).

IV7 (G7, a Lydian dominant chord) is the flat two of a target III7 (F#7) major chord. The III7 (F#7) chord is in turn a V7 chord of a target VIIm (Bm) chord (B Aeolian). Jazz is full of unexpected twists and turns. The expected Bm target chord may turn out to be Bma7 or B7 (see [Melodically Superimposed Cadences/Escherian Cadence](#)).

modify C# Locrian to C# super Locrian by flattening its fourth

C# Locrian II

C# Locrian III

C# Locrian VI

C# Locrian IX

C# Locrian IX

G Lydian dominant VIII

G Lydian dominant XII

C# super Phrygian, an alternative to C# super Locrian

Super Locrian's formula is 1-b2-b3-b4(3)-b5-b6-7. Make super Locrian's fifth natural and you have super Phrygian, a very useful scale.

modify C# super Locrian to C# super Phrygian by making its fifth natural

C# super Locrian I

C# super Locrian III

C# super Locrian VI

C# super Locrian VIII

C# super Locrian IX

C# super Phrygian I

C# super Phrygian III

C# super Phrygian V

C# super Phrygian VIII

C# super Phrygian XII

Super Locrian modifies the Locrian mode by flattening its fourth. The flattened fourth proxies as a major third, providing a mode for a dominant seventh chord with *all* of the alterations used in dominant chords: flat five, sharp five (b6 of the scale), flat nine (b2 of the scale) and sharp nine (b3 of the scale). Super Phrygian is the same as super Locrian, except it has a natural fifth. Its altered tones are sharp five (b6 in a scale or b13 in a super Locrian chord name), flat nine and sharp nine.

Super Locrian could also be compared to Phrygian major with both its third and fourth descended a half step. Phrygian major has scale tones three and four, while super Phrygian has scale tones flat three and flat four, which usually would be used with flat three serving as sharp nine in the high range and flat four serving as natural three in the low range. Super Phrygian is a mode on the third step of harmonic major scale (major flat six scale).

Treat the B7 Chord in Bar Twelve as V of Em

By treating the B7 chord in bar twelve as a V of Em, an Escherian cadence is created, progressing to "Gma7" the relative major of E minor. See Melodically Superimposed Cadences/[Escherian cadence](#).

OVERVIEW

Establishing a Key

The most established chord progression that establishes the I chord as a key (the “C” chord in the key of “C”) is V to I (G to C or G7 to Cma7). An elaboration of that idea evolved in classical music in creating a secondary progression to play the “V” of the “V” chord. In terms of the key of I (“C”), “V of V” is “II”.

The chords in the top staff below are C major scale-tone chords. They are constructed in the traditional manner of constructing triads (three-note chords) with every-other-note of the C major scale. The every-other-note pattern is *thirds*, since each note to the next is inclusively three notes.

The diagram shows a circular fretboard for a guitar in standard tuning (E, A, D, G, B, E). The notes of the C major scale are placed on the fretboard: C (1st fret), D (2nd fret), E (3rd fret), F (4th fret), G (5th fret), A (6th fret), and B (7th fret). The word "thirds" is written in the center of the circle, indicating the interval between consecutive notes.

The musical notation consists of two staves. The top staff is in 4/4 time with a tempo of 60 bpm. It shows the C major scale-tone chords: C, Dm, Em, F, G, Am, Bdim, and C. The bottom staff shows the fret positions for each chord: C (0, 2, 3), Dm (2, 3, 5), Em (2, 4, 5), F (1, 3, 5), G (3, 4, 5), Am (4, 5, 7), Bdim (5, 7, 9), and C (0, 2, 3).

The second musical notation is in 3/4 time with a tempo of 120 bpm. It shows a sequence of chords: C, G, C, C, G, C, C, Dm, G, C. The bottom staff shows the fret positions for each chord: C (0, 2, 3), G (3, 4, 5), C (0, 2, 3), C (0, 2, 3), G (3, 4, 5), C (0, 2, 3), C (0, 2, 3), Dm (2, 3, 5), G (3, 4, 5), and C (0, 2, 3).

“V” of “C” is “G”. “V of G” is “D”, so “V” of “V” in the key of “C” is D (D minor as a triad). In jazz “V of V” is thought of as II. The classic progression in the key of “C”, “Dm-G-C” is called “II-V-I” in jazz.

Chord sequences, such as II-V-I, are called *cadences*. In jazz they are commonly called *turnarounds*.

II-V-I cadences establish a key, or temporary key on a chord. Any important chord in a progression can be thought of a target and temporary key. In a song in the key of “C”, you could make a cadence to the “IV chord” Fma7. In doing so, “F” can be thought of as a temporary “I” chord. II-V chords in the temporary key of F would be Gm7 and C7 (or similar qualities lie Gm9 and C13). During that Fma7 chord, you should simultaneously think in the overall key of “C” by using scales or melodic figures that are common to “C” and “F”. The listener needs to get the sense that you are in the overall key of “C”, yet temporarily resonating the F chord.

II to V is inclusively four scale tones, as is V to I. A flat five substitute may be used for the V chord, where flat five of V is bII of I (b5 of G is Db, which is b2 of I). This makes the substitute progression II-bII-I (Dm7-Db7-C7, for example).

See “Establishing a Key”.

II-V-I Cadences

II-V-I is the most common three-chord progression in jazz. It is well known in establishing a major key with major II-V-I cadences (IIIm6-V7-Ima) and establishing a minor key with minor II-V-I cadences (IIIm7b5-V7-Im). Melodically, there are subtle variants of both major II-V-I and minor II-V-I cadences. Variants include:

- different modes (see, “[Modes](#)”, “[Scale Ambiguity](#)”, [Seven Modal Dominants](#), and [Generic Sets of Numbers for Four Eighths or Sixteenths in Turnarounds](#) for example)
- use of a minor II-V cadence to a I major chord and key (see [Melodically Superimposed Cadences/Escherian Cadence](#)).
- using a [flat five substitute](#) for the V chord (see “[Substitution](#)”/[Flat Five Substitute](#))

In improvised melody, modes may be used that modify what is implied by the current chord progression to suggest different moods, typically darker and/or exotic moods. For example, the key may be A Aeolian, while the scale used is Phrygian, which introduces a dark and exotic flat two (“Bb” is flat two of “A”). Care should be taken to avoid striking conflicts between the mismatched tones of the superimposed scale and the tones of the chord progression. For example, the “Bb” note in A Phrygian would be better to use as a quick note in ornamentation against an A Aeolian chord progression, which may have sustained “B” notes a half step above the “Bb” tone. This concept of changing moods is covered in detail in “[Scale Ambiguity](#)”, “[Substitution](#)” and in “[Melodically Superimposed Cadences](#)”.

Modal Cadences

We need think of notes by number to think of things that we learn in one key and apply the thought to other keys. With modal cadences, any step of a major scale or other seven tone scale can be numbered as “1”, implying it is a key (or temporary key). See the [Modes](#) chapter. After numbering in relation to the related major scale, the chord built on the next higher scale tone would be its modal II chord and the chord built on a root four steps higher would be its modal V chord. For example, based on the C major scale, D minor on the second step could be a “I” chord, making E minor its “II chord” and A minor its “V chord. A major or dominant seventh would be a dominant V chord. See “[Modes](#)”/[Modes of Four Heptatonic Scales](#).

I Type Modes

I type modes imply the mode of the key (since the key is named after scale tone “1”). I is most commonly major (Ionian), Mixolydian, Dorian or Aeolian. Any mode of any of the four harmonizable seven-tone (heptatonic) scales (major, harmonic minor, melodic minor and major flat six) can be established as a key. After the four most common modes major, Dorian Mixolydian and Aeolian, other modes in common use are harmonic minor, Phrygian major, melodic minor and Lydian dominant. See the Table of Common Modes below.

Table of I Type Modes

scale	largest usable chord	arpeggio	relation to major scale
major (Ionian)	ma9/6	ma13	major mode I
Dorian	m13	m13	major mode II
Phrygian	m7	m11b9	major mode III
Lydian	ma13#11	ma13#11	major mode IV
Mixolydian	13	13	major mode V
Aeolian	m11	m11	major mode VI
Locrian	m7b5	m11b5b9	major mode VII
harmonic minor	m9(ma7)	m9(ma7)	major mode VI #5, Aeolian nat. 7
Phrygian major	7b9	7b9	mode III nat. 3, harmonic minor mode V
melodic minor	m9(ma7)	m9(ma7)	major b3
Lydian dominant..			major mode IV b7, major mode
diminished half/whole (Im6b5 focus)	m6b5	m6b5	Lydian dominant with b2 and #2 , instead of 2

II Type Modes

In s II-V-I cadence, II may be Dorian, Aeolian, Phrygian or Locrian. As a chord, the flat six and flat nine are not used, but as an arpeggio flat six and flat nine can be used if not over emphasized. In arpeggio-based melody the flat six and flat nine tones usually act as neighbors or passing tones in relation to chord tones. By playing flat six and flat nine as part of the series of thirds in the parent scale, they sound harmonious. See the Table of II Type Modes below.

Table of II Type Modes

scale	largest usable chord	arpeggio	relation to major scale
Dorian	m13	m13	major mode II
Phrygian	m7	m11b9	major mode III
Aeolian	m11	m11	major mode VI
Locrian	m7b5	m11b5b9	major mode VII

V Type Modes

Including its altered chord versions, there are many types of V chords. Mixolydian, Lydian dominant, Mixolydian flat six, Phrygian major, super Phrygian, super Locrian and diminished half whole (eight tones with b2, b3, 3, #4, 5, 6, b7). See “[Substitution](#)”/Flat Five Substitute. See the Table of V Type Modes below.

Table of V Type Modes

scale	largest usable chord	arpeggio	relation to major scale
Mixolydian	13	13	major mode V
Aeolian dominant	11	11	major mode V b6 melodic minor mode V
Lydian dominant	13#11	13#11	major mode IV b7, major mode
Phrygian dominant	7b9	7b9	mode III nat. 3, harmonic minor mode V
super Phrygian	7b9	7b9#9b13	major flat six mode III
super Locrian	7#5#9, 7#5b9	7#5b5#9b9	major flat six mode VII b4, mel. min. mode VII
diminished half/whole	13b9#9#11	13b9#9#11	Lydian dominant with b2 and #2, instead of 2

bII of I, the Flat Five Substitute of V (bV of V of I is b2)

Especially beginning with bebop around 1940, bII7 (bII^{13#11}) has been substituted for V. It is called a flat-five substitute because it is a flatted fifth from V (bII of the key is bV of V). It is also called a “tritone” substitute, since splitting the octave in half creates an interval of an octave with a diminished fifth exactly halfway between, involving making a relationship between three notes. See “[Substitution](#)”/Flat Five Substitute

The chord synonyms (alternate names) for bII and V chords are shown below. They are all derived from bVI melodic minor in relation to the current key. bII and V progress to a key on I. For example, Db and G are the bII and V of I in the key of C. The bII chords (“Db”) originate on mode IV of bVI (“Ab”) melodic minor and the V chords (“G”) originate on the VII (“G”) of bVI (“Ab”) melodic minor.”

Table of bII and V Chord Synonyms

bII chord name	bII tones	V chord name	V tones
13#11	1-3-5-b7-2-#4-6	7b5#5b9#9	1-3-b5-#5-b7-b2-#2

Flat Five Substitute Cadences

See Lydian Dominant as bII of I, IV or V, Lydian Dominant as bII of V in a Minor Key, "Substitution"/ Flat Five Substitute.

II-V-I COMPING PICKUP AND PUSH RHYTHMS

Establishing a Key on I

As explained at the beginning of this chapter in [Overview/Establishing a Key](#), II-V-I cadences establish a key, or temporary key on the “I” chord. See the chapter “[Establishing a Key](#)” for a broader scope. The I chord can be considered the target, with II-V leading to it with chord roots in fourths.

The II-bII-I Cadence Using a Flat Five of Five Substitute

A flat five substitute replaces the V chord with a chord root a flattened fifth above or below the root of the V chord. See “[Substitution](#)”/[Flat Five Substitute](#). The quality is dominant or altered dominant, making 7, 9, 11 or 13 chords with optional flat or sharp five or optional flat or sharp nine.

Target Chord on Beat One

on beat one or with the optional “push”

Typically a chord featured as “I” in a II-V-I cadence occurs on beat one or pushing beat one. To “push” beat one, the “I” chord is played on the last division of the beat previous to beat one. This is commonly the “and of four”, the last half of the fourth beat. In swing eighths, the first of two eighth notes on the beat gets about two thirds of a beat and the last of two eighth notes on the beat gets the remainder of the beat, making a “short-long” pair for each beat.

With eighth note triplets in 4/4, the three divisions of the beats are traditionally counted “1-trip-let; 2-trip-let, 3-trip-let; 4-trip-let.” With eighth note triplets, the “let” after four is the last division of the fourth beat. With sixteenth notes in 4/4, the four divisions of the beats are counted as follows (“+” is pronounced “and”): “1e+a; 2e+a; 3e+a; 4e+a”. With sixteenth notes in 4/4, the “a” after four is the last division of the fourth beat.

Playing on the last division of the beat previous to beat one (beat four in 4/4, beat three in 3/4, etc.) still suggests that the I chord begins the bar, but syncopates beat one by playing the I chord early on the last division of the previous beat.

See also “[Rhythmic Words and Comping](#)”/[Hearing Pickups and Pushes](#) and see “[Rhythmic Words and Comping](#)”/[Comping Rhythms/Varying Rhythm](#).

Cadence to the Target I Chord with a Pickup

superimposed chords

Cadences are often played in a superimposed manner, where the instrument playing the cadence is playing the II-V (or II-bII) chords in the bar previous to the target I chord while the rest of the instruments are playing a different chord (or chords). “[Melodically Superimposed Cadences](#)” shows how to do this in melody and the principles are the same for a chording accompaniment.

pickup cadences early in the bar for fast tempos, late for slow tempos

When the II-V chords (or II-bII with a flat five substitute) are played earlier in the bar previous to the target I chord, they may create more dissonance when they don't harmonize with the current chord. To lessen the dissonance, such conflicting chord are more acceptable at faster tempos, so the time of dissonance in seconds is two seconds or less.

Conversely, when the II-V chords (or II-bII) are played *later* in the bar previous to the target I chord, they will create less dissonance by lessening the time they don't harmonize with the current chord. With the lesser part of the pickup bar with the cadence chords near the end of the bar, slower tempos can be acceptable, where the duration of the II-V chords (or II-bII) in seconds is two seconds or less.

BUILDING MELODIC TURNAROUNDS

What is a Turnaround?

Arpeggios are chords played one note at a time. Chord-based melodic improvisation in bebop and modern jazz is based on arpeggios. Traditional practice begins by ascending or descending one arpeggio, moving to the nearest note of the next arpeggio, and ascending or descending the next arpeggio. This usually starts by playing four eighth notes for each arpeggio, making two beats for each arpeggio.

From the last note of one arpeggio to the first note of the next, you usually have the option of going up or down in pitch to the nearest note of the next arpeggio. The logic of moving to the next tone is called voice leading. See “[Voice Leading](#)” and the examples below.

The image displays two musical examples of voice leading between Cm7 and F7 arpeggios in 4/4 time. Each example consists of a staff with a treble clef and a guitar fretboard diagram below it. The fretboard diagram has six strings labeled T, A, B from top to bottom. Fingering numbers (1-4) are shown above the notes on the staff.

Example 1: voice leading down to the next arpeggio
The staff shows a Cm7 arpeggio (C4, E4, G4, Bb4) followed by an F7 arpeggio (F4, Ab4, C5, Eb5). The voice leading is down: C4 to F4, E4 to Ab4, G4 to C5, and Bb4 to Eb5. The fretboard diagram shows the notes: C (10th fret, T), E (8th fret, A), G (8th fret, B), and Bb (11th fret, B). The F7 arpeggio notes are: F (10th fret, T), Ab (8th fret, A), C (11th fret, B), and Eb (8th fret, B).

Example 2: voice leading up to the next arpeggio
The staff shows a Cm7 arpeggio (C4, E4, G4, Bb4) followed by an F7 arpeggio (F4, Ab4, C5, Eb5). The voice leading is up: C4 to F4, E4 to Ab4, G4 to C5, and Bb4 to Eb5. The fretboard diagram shows the notes: C (10th fret, T), E (8th fret, A), G (8th fret, B), and Bb (11th fret, B). The F7 arpeggio notes are: F (10th fret, T), Ab (8th fret, A), C (11th fret, B), and Eb (8th fret, B).

Start with Basic Turnarounds Like “Mr. Sandman” then Modify

Begin by learning the basics of turnarounds like the intro to Mr. Sandman, then learn to modify them to make interesting versions that catch the listeners attention and push the art form into new areas. Start with linear turnarounds (see [Linear Major II-V-I Turnarounds](#) and [Linear Minor II-V-I Turnarounds](#)) and regular, rudimentary rhythm, then employ any of these modifications:

- ✦ [Octave Displacement](#)
- ✦ [Vary the Order of Seventh Chord Tones](#)
- ✦ [non-linear turnaround cells](#)
- ✦ [Vary the Turnaround Rhythm:](#) syncopation, pickups and pushes
- ✦ [Six Directional Types of Turnarounds](#)
- ✦ substitute chord progression (see Substitution/[Categories of Substitution](#))
- ✦ using a II-V-I turnaround from a different mode (see the later sections of this chapter)
- ✦ [Chromaticized Turnarounds](#)
- ✦ [Freeform Turnarounds, Voice Leading the Fourth Note](#)

Linear Turnaround Cells

Turnaround cells usually use four notes per chord. In a linear turnaround cells, the four notes ascend or the four notes descend. To build a linear turnaround, ascend or descend the first four-note arpeggio, decide whether ascend or descend the second arpeggio and play through the second arpeggio. The directional combinations of ascending and descending the arpeggios are covered in [Six Directional Types of Turnarounds](#).

Non-Linear Turnaround Cells

In a non-linear turnaround cells, there is at least one exception regarding direction to the four notes of an arpeggio in a turnaround cell. The four notes don't continuously ascend or descend. The directional disorder of the notes doesn't necessarily sound bad. In funky sax parts, for example, the unexpected skips in interval can sound cool, as long as the intervals stay within a octave or less.

Non-linear cells can still have repeating design. For example, 1-5-3-7 or 3-7-1-5 and be either ascending pairs of fifths or descending pairs of fourths. 7-3-5-1 or 5-1-7-3 can be descending pairs of fifths or ascending pairs of fourths.

For other types of non-linear turnarounds, see [Octave Displacement in Turnarounds](#), [1](#), [Vary the Turnaround Rhythm](#), [Categories of Substitution](#), [Chromaticized Turnarounds](#), [Freeform Turnarounds](#), [Voice Leading the Fourth Note](#) and the later sections of this chapter showing II-V-I turnarounds from different modes.

Setup and Target Chords in Turnarounds

Turnarounds are more confined and defined versions of the setup and target phrase discussed in "[Setup and Target Phrases](#)".

Turnarounds with Four Notes on each of Two Arpeggios

Begin building turnarounds in a single major scale fingering. Memorize the arpeggios by playing eight notes up one arpeggio, choosing a nearby note of the second arpeggio and playing eight notes down the second arpeggio, as shown in the example below.

rules to voice-lead two four-note arpeggios in a turnaround

1. Strings five through one are best, to stay in the more audible range. All within a single major scale fingering, play four notes in order, ascending or descending.
2. Move from the last note of the first arpeggio to the first note of the second arpeggio by an interval of a minor third (three frets, inclusively if on a single string) or less. In some cases the interval could be a major third (four frets) or a perfect fourth (five frets), but stick with the minor third rule at first.
3. Continue by ascending or descending the second arpeggio as range permits, until you have played four notes on the second arpeggio.

an example *without* shared-note redundancy on IIm7-V7

Example 1 is shown below. Here are the three steps used to construct it:

1. IIm7 contains notes 2-4-6-1 of the parent major scale. The first four notes of example 1 are a IIm7 (Dm7) arpeggio linearly (in ascending or descending order) by playing C major parent scale tones 1-2-4-6.
2. The V7 chord contains numbered tones 5-7-2-4 of the parent major scale. Continuing in example 1 in the same major scale fingering, “4” is chosen as the first note of the V7 chord, since it is within a minor third of the last note (“6”) of the IIm7 chord in the example.
3. From “5”, the first note of the V7 (G7) arpeggio in example, C major parent scale tones 5-4-2-7 descend the V7 arpeggio.

Example 1 (no redundancy)

Dm⁷ G⁷

C major tones 1 2 4 6 5 4 2 7

Example 2 (redundancy solved)

1 6 4 2 (2) 4 5 7

C major scale
Dm7 in black
VII

C major scale
G7 in black
VII

an example *with* shared-note redundancy on IIm7-V7

Especially in moderate tempo to up-tempo in jazz, blues and rock, it is preferable to keep the notes changing and not play the same note two or more times consecutively, unless there is some rhythmic purpose in it. With seventh or larger chord roots progressing up in fourths (such as IIm7 to V7), this happens when the last tone of the first chord is the root or third. The sequence of major scale roots in fourths is 7-3-6-2-5-1-4. See [Shared-Note Redundancy](#).

If the last note of the IIm7 is a note in the V7, sustain through the second note (a tie in music notation) or omit the first note of the V7 chord and leave a rest of the same value in its place.

Example 2 is shown above. Here are the three steps used to construct it:

1. IIm7 contains notes 2-4-6-1 of the parent major scale. By descending tones 1-6-4-2 on the IIm7 (Dm7), the last tone, “2” is also in the V7 chord and would be a good choice for a small interval (the same note). However, it causes a shared-note redundancy and its preferred to avoid the duplicated note.
2. To keep the notes changing and avoid redundancy the first note of the V7 chord could either sustain the C major parent scale tone “2” that ended the Dm7 chord, or a rest could be used in place of it.
3. The rest was chosen to begin the V7 chord “(2)” is shown below the rest to indicate what the numbered tone would have been if it were played.

Six Directional Types of Turnarounds

Turnarounds are traditionally linear, meaning each arpeggio is ascended or descended in order. Arpeggios are shown below, played in that manner. Turnarounds can also be played non-linearly, whimsically skipping around the tones of an arpeggio. See “[Voice Leading Improv with Arpeggio Cadences](#)”/ [Diatonic Voice leading](#). The graphic examples below are displayed afterward in music notation.

Octave Displacement in Turnarounds

Octave displacements in turnarounds can both add a pleasing melodic effect and often solve problems in having to wide a range of pitch. The descriptions here involve two-chord turnarounds, but the same principles can be applied to turnarounds of more than two chords by looking at each pair of chords in the context shown below.

octave displacment in up/down or down/up turnarounds

In up/down turnarounds, the second, third or fourth note in the first arpeggio can be played an octave lower, then continue in that octave.

In down/up turnarounds, the second, third or fourth note in the first arpeggio can be played an octave higher, then continue in that octave.

octave displacment in up/up or down/down turnarounds

With the up/up or down/down directional designs:

- ✦ the second, third or fourth note in any “up” (ascending arpeggio) can played an octave lower, then continue in that octave.
- ✦ the second, third or fourth note in any “down” (descending arpeggio) can played an octave higher, then continue in that octave.

Octave displacement of the up/continue up and down/continue down turnarounds is redundant, since they become the same as the up/up and down/down, respectively.

Harmonic Agreement by Rhythmic Level

The harmonic nature of what you play differs at different rhythmic levels. With longer the note durations, you have to play more in harmony with the chord. Longer note durations need to stay closer to the chord tones, playing them more often and emphasizing them more. Shorter note values can wander farther away from the chord tones, only emphasizing chord tones with their core melodic tones.

arpeggio-based melody at the eighth note level

Melody at the eighth note level can stay closer to the chord tones with a higher percentage of chord tones and with stronger emphasis of the chord tones by placing them on the beat, ending phrases with them and with whatever other devices you can use to draw attention to them.

Turnarounds are melodic sequences like the introduction to Mister Sandman that are solely arpeggios tones. They provide the safest way to show agreement with the current chord, by playing only tones of the current chord. Turnarounds are played on fairly short durations of a chord, most typically two beats, where four eighth notes are played during the two beats of each chord. The “[descend five and seven](#)” [voice leading](#) concept is useful in constructing arpeggio turnarounds by playing an arpeggio for one chord and descending its fifth and seventh to create the arpeggio for the next chord (whose root is up a perfect fourth from the root of the current chord). If you are intending to precede the next chord with a [secondary dominant](#) that has changed a minor chord to major, be sure to chromatically raise the appropriate note for its major third. Another important one-note change is the “[descend seven](#)” voice leading concept, which is useful to create a ninth chord version of the next chord with no root.

A wide diversity of musicians and composers from Johann Sebastian Bach to Charlie Parker have used devices to put chord tones on the beat, making them more emphasized. The tactic is to stay within the range of a chord where it has been built with every other tone of a scale and go up and down the scale in that range with the chord tones on the beat and the non-chordal tones on the offbeat.

Building Turnarounds With Major Scale-Tone Arpeggios

first, build two-chord turnarounds in fourths

Precede any scale-tone arpeggio with the scale-tone arpeggio down a perfect fourth and play a four note arpeggio of each. Voice-lead so the last note of the first chord moves to the nearest note of the next. In the example below, the chords and arpeggios are shown for the C major scale. Any chord can be established as the key, with the chord before it (on it's left below) making a cadence to it. The Bm7b5 chord can be preceded with Fma7. The arpeggios are shown in larger versions, but you can start with whatever version of 1-3-5-7 each arpeggio has as it is built with every-other note of a seven tone scale (see "[Scale-Tone Seventh Progression](#)" / [Constructing Scale-Tone Seventh Chords](#)). The sequence of chords in fourths is VII-III-VI-II-V-I-IV (B-E-A-D-G-C-F in the key of C).

The qualities of sevenths are listed for the key of C in the second row below (titled "chord" at the left). The qualities of larger chords are listed in the fourth row below, titled "arpeggio". The diagrams in the row below "arpeggio" are numbered in the key of the chord root. The tones on the diagrams in the row below "arpeggio and scale" are numbered in terms of the parent major scale, C major in this case.

Major Scale-Tone Seventh Arpeggios in Perfect Fourths Order, •• Numbered by Parent Major Scale ••

building turnarounds by parent scale number

With parent scale numbering you become aware of the graphic pattern of the scale that is shared by two or more arpeggios in the turnaround you're playing. For each arpeggio you are using in the turnaround, you become aware of each of the subsets of that scale that make up the arpeggio. This graphically unifies your thinking so you can see all of the arpeggios as part of the overall scale. Then when you voice lead the last note of one arpeggio to the first note of the next arpeggio, it is much easier to relate the arpeggios.

Seventh arpeggios are the backbone of turnarounds. In the following sections, you will practice building turnarounds by parent scale number. Turnarounds in eighth notes and sixteenth notes are largely built with seventh arpeggios and the 1-2-3-5 or 1-3-4-5 fragment patterns.

Once you build a few of those turnarounds by number, start building your own with seventh arpeggios and with the 1-2-3-5 or 1-3-4-5 fragment pattern (also in reverse as 5-3-2-1 or 5-4-3-1). The fragment patterns can be built on any triad part of the arpeggio. Turnarounds in triplets largely use seventh arpeggios and chromatics. So, memorize all the seventh arpeggios below. See [Prime Scales, Chords and Arpeggios/Quadrant Arpeggios](#) to memorize the seventh arpeggio fingerings.

Also see "[Voice Leading Improv with Arpeggio Cadences](#)"/Graphically Voice Leading Improv with Arpeggio Cadences/[Scale-Tone Seventh Arpeggios in Perfect Fourths Order, Numbered By Parent Major Scale \(includes secondary dominants\)](#).

shared note redundancy

When the root or third of one arpeggio is the last tone before another arpeggio whose root name is up a fourth, that note will also be in the next arpeggio. It is preferred to avoid paying the same note twice consecutively in driving (aggressive) music like up-tempo jazz. Devices to avoid this shared note redundancy are shown in [Shared Note Redundancy](#).

scale-tone arpeggios in fourths with corresponding chord fingerings below each of them

"III7" is an optional version of III^{Im}7 that makes a stronger progression to the VI^{Im}7 that it precedes. This makes the III7 a secondary dominant. See "[Secondary Dominant](#)", "[Modal II-V-I Cadences and Turnarounds](#)"/[Secondary Dominant](#) and "[Melodically Superimposed Cadences](#)"/[Secondary Dominants](#). To locate the chords, put the numbered tone of the chord root on the large circled note. In the first diagram below, the number seven on the arpeggio diagram needs to be located on the large circled note in the chord diagram below it.

practicing arpeggios in preparation of building turnarounds

Make this exercise with two consecutive arpeggios in the perfect fourths order. There are two versions of III. III7 alters the major scale to major sharp five. III7 is used more often than III \flat m7 to progress to VIm7.

With a regular rhythm, start on the lowest (or next-to-lowest) note (by pitch) of one arpeggio and ascend eight notes with a regular rhythm. Then choose a note of the next arpeggio within a range of a minor third. If it is the same note (see Shared Note Redundancy), you can use a “rest push” by leaving a silence in place of the first note in the second chord. Then descend to complete eight notes down the second arpeggio. If you used a rest in place of the first note, count it as one of the eight. You will then be able to repeat the exercise without stopping, creating a loop. This loop can be played with inverse pitch order by descending from one of the two highest notes in one arpeggio, moving to the first note of the next chord (whose root name is up a fourth) by an interval of a minor third or less, then ascend the second arpegg and create a loop.

Once you have the two arpeggios well in memory, you can play four notes of each, voice leading the last note of the first arpeggio to the first note of the second by a minor third or less and descend four notes in the second arpeggio.

Make the Turnaround More Interesting with Simple Modification

[click here to play a video of the examples below](#)

ascend from the third instead of the root

It can sound too academic and exercise-like to ascend an arpeggio from the root. Ascend instead from the third. If you need a four-note arpeggio, ascend 3-5-7-9 (with any necessary alterations such as b7).

ascend from the root ascend from the third instead

SHARED-NOTE REDUNDANCY

In up-tempo music like blues rock and bebop it is preferred that notes keep changing to provide movement. Exceptions are made, such as when a note is repeated with a notable rhythm.

When the last note of the setup chord (i.e. IIm7) is the same note as the target chord (i.e. V7), any of these devices can be used to avoid playing the same note twice consecutively:

1. Sustain push (tie the two notes). Abbreviation: “SP”.
2. Rest push (put a rest in place of the second note). Abbreviation: “RP”.
3. Lower scale tone neighbor. If possible, change the last note of the setup chord to a lower neighbor scale tone of the first note in the target chord. Abbreviation: “LN”.
4. Upper scale tone neighbor. Change the last note of the setup chord to an upper neighbor scale tone of the first note in the target chord. With the 3-5-7-1 turnaround cell, this makes the first arpeggio a ninth chord. Abbreviation: “UN”.
5. Lower chromatic embellishment. Replace the last note of the setup chord to a note that is a half step below the first note of the target chord. If there is a scale tone a half step below the target tone, this wouldn't be a lower chromatic; it would instead be a lower scale tone. Abbreviation: “LC”.
6. Passing chromatic. When the last setup tone and the first target tone are the same note *and* the last two setup tones are a whole step apart, the last setup tone can be replaced by a chromatic tone between the next-to-last setup tone and the first target tone.
7. Upper blue note. When possible, use a b3, b5, b7 or b9 of the setup chord to resolve down a half step to the first tone of the target chord. The blue note must be a flatted version of a tone in the setup chord. For example, flat three could be a blue note to replace three only if the setup chord originally contained the tone “three”. Abbreviation: “blue”.

See [abbreviations for the last setup chord tone](#) to see the abbreviations for shared note redundancy used in [Linear Major II-V-I Turnarounds](#) and in [Linear Minor II-V-I Turnarounds](#).

LINEAR MAJOR II-V-I TURNAROUNDS

Each of seventeen linear turnaround cells is demonstrated in this section with the six directional types of turnarounds, voice leading and, where applicable, shared-note redundancy. Each example features the turnaround cell of the IIm7 chord, functioning as the setup chord to lead to the V7 target chord.

Here below, the seventeen linear cells are linked to the examples in this section *and* for the Linear Minor II-V-I section that follows. Number in parenthesis are [1-2-3-5 cells](#), except 5712 and 2715 are [1-3-4-5 cells](#).

LINEAR MINOR II-V-I TURNAROUNDS

Each of fourteen linear turnaround cells is demonstrated in this section with the six directional types of turnarounds, voice leading and, where applicable, shared-note redundancy. Each example features the turnaround cell of the IIm7b5 chord, functioning as the setup chord to lead to the V7 target chord.

Here below, the fourteen linear cells are linked to the examples in this section *and* for the Linear Major II-V-I section that preceded this page.

"first chord" and "second chord"

The first chord would typically be a II-type chord and the second chord would be a V-type chord. They would be followed by a I chord. The same principles can be applied to most three-chord cadences, including $bVI7-V7-Ima7$.

the “third” chord

The third chord would usually be a I-type chord and would typically allow freeform rhythm, since it is not “wedged” in time between two other chords.

progress toward freeform improv with a turnaround basis

Basing the melody on chord tones has always been the foundation of melody. Jazz is heavily based on seventh chord and larger arpeggios. Particularly since the bebop era (1940-1960), players like Charlie Parker, John Coltrane, Cannonball Adderley, Sonny Rollins and Stan Getz practiced playing the changes (the chord progression) in turnarounds, and evolved the turnarounds to freeform improv. Listening to the later, more evolved style of each of them, where they progressed to freeform improv, it may be difficult to hear the relationship to turnarounds. If you listen to their repertoire chronologically, you can hear the evolution. In an interview with Paul Desmond, Charlie Parker said he practiced 11 hours or more per day in the first few years of his development. Usually musicians over-estimate their serious practice time, but listening to the results, Charlie may not have been exaggerating.

Each of us should build our own such evolution.

four-note turnaround basis

In this “Vary the Turnaround Rhythm” section, play the Linear Major II-V-I and Linear Minor II-V-I examples again. They are thorough. Use the options stated above to apply different rhythm options for each of the chords.

rhythms for the first chord

The first chord would typically be a II-type, the first chord of a minor II-V-I or of a major II-V-I. There is usually time to play before the first beat of the first chord (i.e. the II chord), which allows the pickups shown on the left of the “first chord” table above. That implies variation on the original concept of the first chord, with four eighth notes or four sixteenth notes by playing some of the notes early as pickups.

The first chord could alternately be played by dividing its duration in half and playing a triplet in each half. This would usually be two eighth note triplets during two beats.

rhythms for the second chord

The second chord is more confined, being between the first and third chords (i.e. V between II and I). The second chord would typically be a V-type, the second chord of a minor II-V-I or the second chord of a major II-V-I. It can be played as four eighths or four sixteenths. It can be varied by omitting one or two of the notes, as shown on the “second chord” table above.

Like the first chord, the second chord could alternately be played by dividing its duration in half and playing a triplet in each half, usually be two eighth note triplets during two beats.

Four-Pulse Cadence Rhythms

rhythms for the first, middle and last chords in a cadence

Follow the convention of using four notes on each chord as in traditional turnarounds. The first and last chord in a turnaround have the most flexibility. With the first chord, you can play notes early, leading into the intended beat for the chord with pickups and pushes.

If there are three or more chords in the cadence, the middle chords have the least flexibility rhythmically. Since they have a chord before them and after them, they are usually played on the intended beats without much flexibility.

The last chord in a cadence provides the most freedom. Practice segueing into content beginning with the last chord that stays at the same rhythmic level as the turnaround.

pickups and pushes on the first chord in a cadence, four-note turnarounds

Triplets in Turnarounds

triplet rhythms for any chord in a II-V-I cadence [click to play video](#)

These are based on two triplets per chord, written here as two beats of eighth note triplets per chord. The three parts of each triplet are counted below as “123”. “13,23” represents the first and third parts of the first triplet and the last two parts of the second triplet.

Table of Triplet Rhythms for Any Chord In a II-V-I Cadence

start on beat 3, target on beat 1		3	t	1	4	t	1	notation
start on beat 1, target on beat 3		1	t	1	2	t	1	
123, 123	triplet, triplet							
1, 123	beat, triplet							
12, 123	“trip”, triplet							
3, 123	pickup to triplet							
13, 13	swing, swing							
13, 12	swing, Afro-Cuban							
13, 23	swing, waltz							
12, 13	Afro-Cuban, swing							
12, 12	Afro-Cuban, Afro-Cuban							
12, 23	Afro-Cuban, waltz							
23, 13	waltz, swing							
23, 12	waltz, Afro-Cuban							
23, 23	waltz, waltz							
13, 123	swing, triplet							
12, 123	Afro-Cuban, triplet							
23, 123	waltz, triplet							
123, 13	triplet, swing							
123, 12	triplet, Afro-Cuban							
123, 23	triplet, waltz							

The rhythms in the table above could also be played as one beat with two sixteenth triplets (with different counting). The first chord in a II-V-I cadence is II and the first chord in a V-I cadence is “V”.

VARY THE ORDER OF SEVENTH CHORD TONES

Explore All of the Possible Orders of Seventh Chord Tones

There are twenty-four orders of seventh chord tones. Players typically play a few of the possibilities, but don't explore them all. Build your memory of all the possible orders of tones for a particular seventh chord in each of the octave shapes. Start with specific orders of seventh chord tones by playing them in rows or columns in the table below. Then whimsically explore orders of arpeggio tones for a seventh chord all in one octave shape.

include inversions

Include inversion, as permitted by the range of chord tones in the octave shape you are playing in. 1357 can be played in ascending order, or "1" could be followed by the "3" below it in pitch, then ascend to "5" and "7".

Possible Orders of 1-3-5-7

1357	1375	1537	1573	1735	1753
3571	3517	3715	3751	3157	3175
5713	5731	5137	5173	5317	5371
7135	7153	7315	7351	7513	7531

Generic Numbers

The numbers in the table below are "generic". "1" is the chord root, the letter name after which the chord is named. For a Db major seventh chord, "1" represents "Db". "3" represents the third of the chord whether it is a natural third or a flat third. "5" represents the fifth, regardless whether it is a perfect fifth (natural fifth) or a flatted fifth. Likewise, "7" represents flat seven or natural seven.

Learn to create the table above in your mind to prepare to more fluently improvise on a chord in a particular area of the fretboard. All of the fourth digit numbers in each row start with the same number.

The four-digit numbers in the first row all start with "1", in the second row with "3", in the third row with "5" and in the fourth row with "7". With a little study, you should be able to re-create the table without looking at it.

	Cmaj7	C7	C7	Cm7	Cm7
literal numbers:	1 3 5 7	3 5 b7 1	3 5 b7 1	1 b3 5 b7	5 b3 1 b7
generic numbers:	1 3 5 7	3 5 7 1	3 5 7 1	1 3 5 7	5 3 1 7
T		9			8
A					
B	8 7 10 9	10 8 10	7 10 8 10	10 11 10 8	10 8 10 8

the first pair of four-digit numbers in a row (1357 and 1375)

In the sequence of numbers in each row, first the second number is the next-higher pitch in the chord (3 in 1357, for example) followed by the remaining numbers in order of pitch, then in reverse order (1357 ends with “57”, then 1375 ends with “75”).

the second pair of four-digit numbers in a row (1537 and 1573)

Next, the first tone (“1”) is followed by the next higher chord tone (5), then the remaining two numbers, then another version with the remaining numbers in reverse order (1537 ends with “37”, followed by “1573”, which ends with “73”).

the last pair of four-digit numbers in a row (1735 and 1753)

With the last pair of four-digit numbers, the first tone (“1”) is followed by the highest chord tone above it (7), then the remaining two numbers, then another version with the remaining numbers in reverse order (1735 ends with “35”, followed by “1753”, which ends with “53”).

ENHANCED TURNAROUNDS

This section will show the turnarounds most commonly in use. They show the six directional types of turnarounds shown earlier in this chapter: up/down, up/continue up, up/up, down/up, down/continue down and down/down. The tables below shows two or three chords of a turnaround. These are [modal cadences](#) and can be built on any step of a major scale or other seven tone scale.

preview of a typical turnaround study session on a IIm7-V7 cadence

For 90 seconds, play eight notes on IIm7 arpeggio and eight notes on V7 arpeggio.

The image shows a musical exercise for a Swing Eighths IIm7-V7 cadence. On the left, there are two fingering charts. The first chart is for IIm7 (Dm7) and the second is for V7 (G7). Both charts show three rows of notes with fingerings (1-5) indicated. The first row of IIm7 is 7 3 6 2 7, and the first row of V7 is 7 3 6 2 7. The second row of IIm7 is 1 4 7 3 5, and the second row of V7 is 1 4 7 3 5. The third row of IIm7 is 2 5 1 4 6, and the third row of V7 is 2 5 1 4 6. To the right of the charts is a musical staff with a treble clef and a key signature of one flat (Bb). The tempo is marked 'Swing Eighths'. The first measure is labeled 'Dm7' and the second measure is labeled 'G7'. The melody line consists of eighth notes. The first measure of the melody is D4, E4, F4, G4, A4, Bb4, C5, D5. The second measure of the melody is D5, C5, Bb4, A4, G4, F4, E4, D4. The bass line consists of eighth notes. The first measure of the bass line is D3, C3, B2, A2, G2, F2, E2, D2. The second measure of the bass line is D2, C2, B1, A1, G1, F1, E1, D1. The staff ends with a double bar line and repeat dots.

Build a four-note-per-chord turnaround by playing four notes of each arpeggio. Phrase it so the V7 arpeggio starts on the first beat of the V7 chord.

For about five minutes, use the turnaround in improv over an accompaniment that loops (repeats) the IIm7-V7 progression. Use a looper, a program like iReal pro, or a recording of you playing the accompaniment repeatedly for a few minutes. Make it a point to play the original turnaround about every four times through the chord progression, playing it intact. Work to segue seamlessly into and out of the turnaround.

Next, modify the arpeggios with decorations: change of rhythm, add a note or two to lead into the first arpeggio, use bebop ornamentation. See "[Core Melody with Baroque-Bebop Ornamentation](#)".

Again, for about five minutes, use the enhanced turnaround in improv over an accompaniment of the IIm7-V7 progression. Make it a point to play the enhanced turnaround about every four times through the chord progression, playing it intact. Work to segue seamlessly into and out of the turnaround.

Repeat all the steps above with each turnaround cadence.

Building Your Own Enhanced Turnarounds

why can't I just memorize a few turnarounds and be done with it?

You could, but that is likely to only get you through three or four songs. What are you going to use for variety in turnarounds on additional songs and at additional performances? It's good to learn a few great examples of turnarounds, then begin to learn to build your own.

steps to building your own turnarounds

There are innumerable turnarounds and we can't practically memorize all of them. But we can develop a system to quickly conceive and build them while we're playing. We need to have many turnarounds memorized as models and know how to construct more.

1. Thoroughly learn the families of seventh arpeggios, each in five octave shapes.
2. Practice Examples of Basic Turnarounds in Seventh Arpeggios, below.
3. Learn at least major ninth, dominant ninth and minor ninth arpeggios in five octave shapes.
4. Memorize at least the minor eleventh arpeggios in five octave shapes.
5. Practice making up arpeggios with the generic number system on the following pages, so you can voice-lead arpeggios from one to another.
6. During the course of practicing the generic numbering system on the following pages, learn the rhythms with which they are played.

Examples of Basic Turnarounds in Seventh Arpeggios

Typical turnarounds use four notes per chord.

Conceiving Turnarounds in Generic Numbers

four-note turnaround cells

Sets of four numbers are used in these tables to represent the turnaround, such as 1-3-5-7 representing C-E-G-B on a Cma7 chord. The numbers shown on these tables show the scale-tone numbers for the chord scale you are using *generically*, without any flats or sharps. Each set can be adapted to the scale you are using for any particular chord by flattening or sharpening notes as the scale directs. For example, in using Aeolian mode on a minor seventh chord where the four-note set of numbers is 5-6-7-2 would be 5-b6-b7-2, since Aeolian has the numbered scale tones 1-2-b3-4-5-b6-b7.

Most of the turnaround examples in this chapter are linear turnaround cells. When they are non-linear turnarounds instead, they are specified as non-linear. See the earlier [Linear Turnaround Cells](#) and [Non-Linear Turnaround Cells](#), in the [Building Melodic Turnarounds](#) section.

Generic Sets of Numbers for Turnarounds

text description of turnaround cells on a setup chord with generic numbers

Any chord before the last chord in a cadence can be thought of as the “setup chord: in designing its voice-leading to the next chord. 1235-type options are in parenthesis.

End on 5 or 7: ascend 1357, 7135 (3457, 1235); descend 3175, 2175, 5317 (2765). Resolve up or down a scale step.

End on 2: ascend 3572 (5672): ascend from third of a ninth-resolve up or down a scale step.

End on 1: ascend 3571; descend 7531 (5321). Resolve up a fourth (not if the fourth is diminished) or resolve down a minor third if the scale permits.

End on 3: ascend 5713; descend 1753 (7543). Resolve up a scale step or resolve down a minor third if the scale permits.

The turnaround cells on the table below are numbered in chord scale. Each cell represents four eighth notes or four sixteenth notes. The eighths or sixteenths may be swung .

The “last note” of the first chord on the table below doesn’t necessarily progress to the “first note” of the second chord shown in the same row. The last note on the first chord can move to any note within a minor third to start the second chord, including same note (the last note of the first chord the same as the first note of the second chord). See [voice leading turnaround cells](#) below.

table of turnaround cells 1235-type options are in parenthesis.

UP FIRST CHORD		UP SECOND CHORD	
first chord up	last note	first note	second chord up or continue up
1357, (3457)	7	7	7135
3571	1	1	1357, (1235)
3572 (5672, 5712)	2		
5713	3	3	3571, (3457), 3572
7135 (1235)	5	5	5713, (5672, 5712)
DOWN FIRST CHORD		DOWN SECOND CHORD	
first chord down	last note	first tone	second chord down or continue down
5317	7	7	7531 (7543)
7531	1	1	1753
		2	2753 (2765, 2175)
1753, 2753 (7543)	3	3	3175
3175, (2175, 2765)	5	5	5317

voice leading turnaround cells

With the chord scale number context used on the [table of turnaround cells](#), the numbers of the first chord are in a different key than the second chord. When you arrive at the last tone of the four-note turnaround cell played on the first chord, you need to decide on a first note for the second chord within an interval of a minor third or less.

To speed up the decision making. Learn the interval range for each four-note turnaround cell type: root position, first inversion, second inversion, third inversion, 1-2-3-5 and 1-3-4-5. A seventh chord arpeggio ascending it's root to seventh or descending its seven to root is an interval span of a seventh. First, second and third inversions span a sixth. 1-2-3-5 and 1-3-4-5 span a fifth. Learn the graphic shape and fingering for major and minor sevenths, major and minor sixths and for perfect, diminished and augmented fifths. Further, learn all the arpeggios that span these intervals, meaning all fingerings for all seventh chord arpeggios.

extending the table of turnaround cells

To extend the [table of turnaround cells](#) to three or more chords, first treat each chord after the first chord as shown as a “second chord”, paying attention to the first note of the second chord so you voice lead from the last note of the first chord. For additional chords, voice lead the last tone of the previous chord to the *first note* of the current chord, using the “first chord” on the table as the previous chord and the “second chord” on the table as the current chord.

Although the model cadence is II-V-I, the concept of generic numbers for turnarounds can be applied to any cadence. Other common cadences are I-VI-II-V, III-VI-II-V, I-VIm-IV-V and IIm-bII-I.

SECONDARY DOMINANT

The Dominant

The dominant in any key is on the fifth step of its scale. “G” is the dominant in the key of “C”. In a major key, the most common chord progression is the *authentic cadence* from V to I, a chord built on the fifth step of the scale (“G” or “G7” in the key of “C”) progressing to the chord built on the first step (a “C” chord in the key of “C”).

The V Chord In Minor Mimics the V chord in major

Aeolian mode is converted to harmonic minor in order that the minor key V chord is major (1-3-5) or dominant seventh (1-3-6-b7). In A minor, the E minor chord on its fifth step is more often than not changed to E major or E7, making the stronger cadence from E(7) to Am, replacing the weaker Em(7) to Am.

Likewise with the other two common modes used as keys in the major scale, Dorian and Mixolydian, the V chord in each of those modes can be changed to major or dominant seventh to strengthen the progression. The scales in the key of each of the three types of V chords for Aeolian, Dorian and Mixolydian are named after the mode on each respective V chord, as shown below.

Dominant Chords Can Be Built on All Seven Steps of the Major Scale

See “[Voice Leading Improv with Arpeggio Cadences](#)”/Graphically Voice Leading Improv with Arpeggio Cadences/[Scale-Tone Seventh Arpeggios in Perfect Fourths Order, Numbered By Parent Major Scale](#) (includes secondary dominants).

A [secondary dominant](#) chord mimics the V-I (G or G7 to C in the key of C) relationship by preceding any target chord with a major or seventh chord, on the fifth step of the key of the target chord. For an Am target chord, the secondary dominant is E or E7, chords built on the fifth step in the key of A. For an F chord, the secondary dominant is C or C7, chords built on the fifth step in the key of F. To emphasize a change of chord quality even farther for a secondary dominant, use more altered tones such as the flat nine, sharp nine and sharp five that are typically used on the V chord in a minor key.

secondary dominants need to use a noticeable change in quality.

To use a secondary dominant of an F chord in the key of C, use a C7, since C major is already part of the C major scale, while C7 changes the C major scale with the Bb note in the C7 chord. If your target chord is G in the key of C, the secondary dominant could be either D major or D7 (both of which sharp

the F of the C major scale. So secondary dominants are based on changing a minor chord to major or dominant seventh or changing a major to a seventh when doing so changes the scale.

Here's a list of common secondary dominants and their targets for the key of C major: I7 to IV (C7 to F), II or II7 to V (D or D7 to G), III or III7 to VI or VI7 (E or E7 to A), VI or VI7 to IIm or II (A or A7 to Dm or D). V or V7 to I (G or G7 to C) is not a *secondary dominant* to a target, since G and G7 are already part of the C major scale.

In addition to the dominants used on steps III, VI, II and V, dominant chords can be built on I, IV and VII. I dominant seventh is the V of IVma7. IV dominant seventh is the flat V of VIIIm7b5, with root progression up and *augmented* fourth instead of the usual perfect fourth. Practice IV super Locrian to VIIIm7b5.

A seventh modal dominant type is Locrian dominant (using super Locrian), using VII7#5b9 (B7#5b9 in the key of C) to IIm or IIm7 (Em or Em7 in the key of C). Rather than raising Locrian's flat three to natural three, flat its fourth, so the parent scale is major flat three, commonly called melodic minor. This Locrian b4 scale is called super Locrian.

II-V-I Cadences Use Secondary Dominants

All II-V-I cadences use secondary dominants *except* the traditional major II-V-I, where the V dominant chord is part of the scale without modification. II-V-I cadences are all based on three chord roots ascending in perfect fourths, like "D" to "G" to "C". The two classic "II-V-I" cadences are the "major II-V-I" and the "minor II-V-I". The major II-V-I is literal, its "II-V-I" (Dm-G-C, in the key of C). V makes the strongest progression to the target "I". Secondarily, II makes the strongest progression to V. In sequence, they make "II-V-I".

The minor II-V-I is derived from the major scale. It uses chords with their roots ascending in fourths on scale tones VII, III and VI (B, E and A of the C major scale). In terms of the key of the target key A minor, "II" would be "B", "V" would be "E" and "I" would be "A". VIIIm7b5-IIIIm7-VIm (Bm7b5-Em7-Am) in the parent major scale (C major) provides this progression. To strengthen the progression, the IIIIm7 (Em7) is changed to III7 (E7), a dominant seventh chord, mimicking the classic V7-I (G7-C) cadence in a major key. The tactic is to use E7 to A minor as you would use E7 to A major in the key of A.

Modal II-V-I Cadences

Preceding any of the secondary dominants with the chord whose root is down a perfect fourth, can produce various types of "II V" cadences. If the secondary dominant is "V", the root down a perfect fourth from it is "II". By then following through to the target I chord whose root is up a perfect fourth from the dominant V chord, a modal II-V-I cadence is produced.

II-V-I cadences are commonly used in the forms of major IIm7-V7-I (a major II-V-I cadence) and minor IIm7b5-V7-Im (an Aeolian II-V-I cadence) in popular music, especially jazz. The Dorian and

Mixolydian II-V-I cadences are very useful also, though not explored as thoroughly as they could be. The four most common modal II-V-I cadences we'll explore are shown below. The "modal II chord" is built on the second step of the scale of the target chord. The "modal V chord" is built on the fifth step of the scale of the target chord. In each case except the major II-V-I, the modal V chord is changed from its minor quality to a major quality and usually elaborated to a dominant seventh or larger chord. The "modal II chord" and the "modal V chord" below are numbered in terms of the parent major scale. Literal lettered examples in parenthesis (i.e. Bm7b5) use the C major parent scale.

changing modal II-V-I type with V as a secondary dominant

Think in the key of the target chord, but change the mode when making the chord a secondary dominant. In changing the V chord to secondary dominant, it is changed to dominant seventh or altered dominant seventh, unless it already is a dominant seventh, as in major mode with V7 as an unaltered scale-tone chord.

mode	II chord in parent scale	V chord in parent scale	secondary dominant V, chord scale, key scale during secondary dominant V	I chord in parent scale	II-V-I
major	IIm7	V7	V7 (no change) chordscale V Mixolydian key scale major	IIm7	IIm7-V7-IIm7
Dorian	IIIm7	VIIm7	VI7 (VI9, opt. #5) chordscale VI Aeolian dominant key scale melodic minor	IIIm7	IIIm7-V7-Im7
Mixolydian	VIIm7	IIm7	I17 (II13) chordscale II Mixolydian key scale major	V7	IIm7-V7-I7
Aeolian	VIIIm7b5	IIIm7	III7 (III7b9 opt. #5) chordscale E Phrygian dominant key scale harmonic minor	VIIm7	IIm7b5-V7-Im7
melodic minor	IIm7	V7	V7 (V9, opt. #5) chordscale Mixolydian flat 6 key scale melodic minor	Im6	IIm7-V7-Im6
Lydian dominant	V7	Im6	I7 (II13) chordscale Mixolydian key scale major	IV7	I17-V7-I7

changing modal II-V-I types in the same key

For the purpose of [Scale Ambiguity](#), with darkening and brightening, you will also need to be able to play different modal II-V-I cadences all the same key. When you play them all in the same key, each of the four types you may choose from use a different parent major scale. This makes it more complicated, so practice jamming on one of the II-V-I cadences in a particular key at a time until you can freely change between the types.

thinking modal II-V-I cadences in different contexts

At times, you may find it useful to think in each of four different contexts for all three of the chords in the cadence in terms of (1) the parent scale, (2) altered parent scale for the V chord, (3) the chord scale for the dominant V mode, (4) the unaltered II-V of the target chord and (5) the altered II-V of the target chord.

II-V-I Turnarounds For All Seven Major Scale-Tone Chords

The unaltered parent scale for all of these is I major.

target	VIm9	IIm9	V9	Ima9	IVma9	VIIIm11b5b9	IIIm11b9
seventh tones of parent	6135	2461	5724	1357	4613	7246	3572
unaltered V of	IIIm7 (m11b9)	VIm9	IIm9	V9	Ima9	IVma9	VIIIm7b5 (VIIIm11b5b9)
dominant V of	III7b9	VI9	II9	V9	I9	IV9	VII#5#9
altered parent scale	I major #5 or I major b6	I major #1*	I major #4	no change	I major b7	I major b3 (mel. min)	I major b3 (mel. min)
dominant V mode	III Phry. dom. or III super Phry.	VI Aeolian dominant	II Mixolydian (II mel. minor)	V Mixo.	I Mixo	IV Lydian dominant	VII super Locrian
unaltered II V of	VIIIm11b5b9-IIIIm11b9	IIIm11b9-VIm9	VIm9-IIIm9	IIm9-V9	V9-Ima9	Ima9-IVma9	IVma9-VIIIm11b5b9
II-dominant V of target	VIIIm11b5b9-III7b9	IIIm11b9-VI9	VIm9-II9	IIm9-V9	V9-I9	Ima7-IV9(13#11)	IVma9-VII#5#9

*I major #1 (=VII super Locrian) has the same notes as II Dorian natural 7 = II melodic minor.

employ simple modifications to turnarounds (sketching):

- Ascend from the third and tend to use the upper part of ninths.
- Precede the first note with a lower chromatic embellishment.
- Omit any of the four notes (in a four-note turnaround), leaving the others in their place in time. Go to Rhythmic Words and Comping/Four Pulse Rhythmic Words/Strumming Four-Pulse Rhythmic Words and use any of the rhythms that use seven notes.
- Omit two of the four notes. In strumming Four-Pulse Rhythmic Words and use any of the rhythms that use six notes. In playing a II-V with four-note arpeggios, choose the rhythm that has the omitted notes in the appropriate place. If the “II” has no omitted notes, use a rhythm that begins with four sixteenths. The examples are based on two sets of four sixteenths (or four eighths). Wherever you omit notes, use a rhythm that matches. In another sense, there are only 15 different rhythms made with four pulses. Learn them all at Rhythmic Words and Comping/ Four-Pulse Rhythmic Words/All Possible Four-Pulse Rhythmic Words.
- Change the melodic rhythm.

Consecutive Secondary Dominants

A secondary dominant can be a secondary dominant of another secondary dominant. A7 could be the secondary dominant of Dma7, E7 could be the secondary dominant of A7 and B7#9 the secondary dominant of E7. See Secondary Dominant/Consecutive Secondary Dominants.

Avoid Conflicts Between The Current Chord and II-V-I Type

turnarounds are usually based on one parent scale

A cadence is often played in the form of a turnaround with the II-V part of the cadence played at the end of the chord preceding the target chord and the “I” part of the cadence played on the target chord.

The notes of a turnaround are usually tones of a single parent scale. If the V chord in the turnaround has been changed from a minor seventh to dominant seventh to create a secondary dominant, a note in the parent scale is raised to change its third from minor to major. This is the case with IIm7 changing to II7 to act as a V7 of V; IIIIm7 changing to III7 to act as a V7 of VIm; and VIm7 changing to VI7.

A Ima7 chord can be changed to a secondary dominant by flattening its seventh, so it can act as a V7 of IV.

clashes

Clashes can occur when *flatted* versions of numbered notes (like flat three) are used in the turnaround during the chord preceding the target chord and *natural* versions of the same numbered tones (like natural three) are in the target chord. These clashes are mood mis-matches, where the accompaniment chord is dark-mooded and the turnaround arpeggio played over it is brighter in mood.

spot potential clashes by mood and mode and solve the problem

When the chord preceding the target chord sounds darker and/or bluesier, it is likely to have flatted versions of the same numbered tone. Use a darker, bluesier version of the turnaround that matches the chords. Here is an order of turnarounds from dark mood to bright mood:

dark - minor II-V-I turnaround (VIIIm7b5-III7-VIm7 of the parent major scale)

medium dark - Dorian II-V-I turnaround (IIIIm7-VI7-IIm7 of the parent major scale)

medium bright - Mixolydian II-V-I turnaround (VIm7-IIm7-V7 of the parent major scale)

bright - major II-V-I turnaround

In a traditional minor II-V-I cadence in the key of A minor, the chords are derived from C major parent scale-tone chords VIIIm7b5-IIIIm7-VIm7 (Bm7b5-Em7-Am7). The IIIIm7 is changed to III7, making

the progression VIIIm7b5-III7-VIm7 (Bm7b5-E7-Am7). This makes the parent scale all C major, except C major sharp five during the III7 chord.

In a Dorian II-V-I cadence in the key of D minor, the chords are derived from C major parent scale-tone chords IIIIm7-VIm7-IIIm7 (Em7-Am7-Dm7). The VIm7 is changed to VI7, making the progression IIIIm7-VI7-IIIm7 (Em7-A7-Dm7). This makes the parent scale all C major, except C major sharp one during the VI7 chord.

In a Mixolydian II-V-I cadence in the key of D minor, the chords are derived from C major parent scale-tone chords VIm7-IIIm7-V7 (Am7-Dm7-G7). The IIIm7 is changed to II7, making the progression VIm7-II7-V7 (Am7-D7-G7). This makes the parent scale all C major, except C major sharp four (C Lydian) during the II7 chord.

spot potential clashes with key signatures and scale-tone chords

In this order of major scale key signatures, the mood would get brighter from left to right if you used a single tone center through a number of key signatures. For example, the note “G” is in the major scales “Ab” through “D”.

Cb-Gb-Ab-Eb-Bb-F-C-G-D-A-E-B-F#-C#

If you cannot already, learn to recognize scale-tone chord types by reading [Recognizing Scale-Tone Chords](#). If you can recognize the scale tone on which each chord is likely to have been built you can then determine the parent scale.

You can consider the change of parent scale according to key signature. If the chord preceding the target chord uses a flatted numbered tones in relation to the parent scale of the target chord, consider a key signature to the left (in the series above) of the key signature for the parent scale.

changing parent scale produces an Escherian cadence

Changing parent scale during the chord preceding the target chord to avoid conflicts is usually a good thing. You can then change the parent scale type on the target chord and brighten the mood, producing an unexpected bright mood. This is a form of an Escherian Cadence. See [Melodically Superimposed Cadences/Escherian Cadence](#).

example on a G jazz blues progression

Improvising on a blues in G, for example, you may intend on playing a Mixolydian II-V-I turnaround that targets the G9 chord in bar seven. In doing this you would typically play the II-V part of the cadence in a turnaround at the end of bar six. Bar six is a C7 chord, which contains a “Bb” note. If you use a G Mixolydian II-V-I turnaround (VIm9-II9-V9 of the parent scale C major) with the chords Am9-D9-G9, the Am9 arpeggio includes the note “B”. That is likely going to be a problem. Solve

the problem by using a G Dorian II-V and a G Mixolydian I. You might call this a “hybrid II-V-I” turnaround, since it started as G Dorian and ended as G Mixolydian.

MAJOR SCALE-TONE TURNAROUNDS IN FOURTHS

Six Directional Designs

See Modal II-V-I Cadences and Turnarounds/Building Melodic Turnarounds/[Six Directional Types of Turnarounds](#). These all use linear four-note cells, continuously ascending or descending for four notes. The examples in this section are grouped in the six directional types of turnarounds. Each type has one of the six designs shown below. Use the link above each graphic below to go to the corresponding section of turnarounds.

voice leading at the transition between four-note cells

If the last note of a four note cell is not the same note as the first note in the next four-note cell, you have the option of going up or down a scale tone to begin the next cell. See [Shared-Note Redundancy](#). In driving styles like bebop and up-tempo blues, it is usually preferred that you make a change so the same note doesn't occur twice consecutively. This can be done by replacing the first note in the second cell with a rest or a sustain. The shared-note redundancy can also be solved by changing the last note of the first cell to a neighboring tone. If the first cell is linearly ascending to a shared-note redundancy, replace the fourth note with an upper neighbor of the first note in the second cell. If the first cell is linearly descending to a shared-note redundancy, replace the fourth note with an lower neighbor of the first note in the second cell.

Triplet Arpeggio Chromatics

E^{7(b9)} note the exception to two chromatics below each chord tone regarding the notes between the root and third of this arpeggio

Chromatic Arpeggio Encircling

Also see the chapter [Chromaticed Arpeggios](#), especially Chromaticed Arpeggios/[Encircling Chromatic Sequences](#).

The musical score illustrates the Chromatic Arpeggio Encircling technique for seven chords: **Bm7(b5)**, **E7(b9)**, **Am7**, **Dm7**, **G7**, **Cmaj7**, and **Fmaj7**. Each chord is represented by two staves. The first staff shows the arpeggio, and the second staff shows the chromatic encircling sequence, which starts on the root of the chord and moves chromatically up and down the scale, eventually returning to the root. The sequence is marked with measure numbers (1-4 for Bm7(b5), 5-8 for E7(b9), 10-13 for Am7, 15-18 for Dm7, 20-23 for G7, 25-28 for Cmaj7, and 30-33 for Fmaj7).

two above, one below on each arpeggio tone of one chord

Apply (1) “2 above, one below” (push version) to the tones of C9 on beat 3 in Blues in C by playing four eighths on beat 3, creating a push in that the target tone is on the “+” after four.

tail out

Following each four note cell, immediately continue on the I7 (I9) arpeggio, involving skips and syncopations made with pairs of 4-note cells or 3-note cells. If your target is on 3, for example, follow with b7-1-5.

lead in to beat 3.

Precede each four note cell on beat 3 with improvisation on beats one and two, then with improv pickup to beat one as well.

precede each four note cell with a V7, V9 OR V7b9 (G7, G9, G7b9) arpeggio

Voice the V arpeggio so its last note is close in pitch to the first note of the C7 cell (2 above, one below). The V7 can start beat 3 so the C7 figure is on beat 1, or the V7 can start on beat 1, so the C7 figure is on beat 3 and anticipates beat 1. If the tempo is too slow, the V7 may be too dissonant harmonically on beat 1 or even on beat 3. The G7, G9, G7b9 or G13 arpeggio could be an arpeggiated held chord, in the Charlie Christian style. With consonance of your improv lead in and tail out, the V7 and the first three notes of the chromaticized cell should be more acceptable to the listener in context.

add a chord tone to the beginning of the cell

This changes the chord tones’ relationship to the beat with the target on the beat, instead of pushing the beat. Now, instead of “2 above, one below” as three notes and a target, play it as four notes and a target, as follows: precede the the “2 above, one below” figure with a nearby chord tone on the beat so the remaining four notes end with the target on the beat.

Apply this to the whole series above. Make sure that the added note is on the beat. In swing, it would be the “long” note of the long and short pairs. Solve shared note redundancies (on figures that play the target on the beat) with a push or by replacing the fourth note of the cell with a neighboring tone of the target. You often would need to choose a different voicing of the V chord, so its last note is nearby the added chord tone at the beginning of the C melodic cell.

eleven types of chromaticized arpeggios

Do the whole series above on:

1. “two above, one below” and a triplet version
2. “one below, two above” and a triplet version
3. “two below, one above” and a triplet version
4. “one above, two below” and a triplet version
5. “two below, two above”
6. “two above, two below”
7. triplet arpeggio chromatics
8. chromatic arpeggio encircling
9. linear chromatics repeating the target as the the second note
10. linear chromatics with a nearby chord tone as the second note
11. linear chromatics with a nearby chord tone as the fourth note

cadences (turnarounds)

Make four-beat cadences with all chromaticized cell types, two beat cadences with type 1-4 (not encircling nor 4-note linear).

decorate with mordents, turns and trills.

combining a minor II-V cadence turnaround with arpeggio inversion and basic chromatic encircling on Im7

Swing Eighths

♩ = 150

The musical score is written in 4/4 time with a tempo of 150 beats per minute. It consists of 32 measures, divided into two systems of 16 measures each. The key signature has one flat (B-flat), and the time signature is 4/4. The score is written in treble clef. The first system (measures 1-16) features a sequence of chords: Bm7(b5), E7, Am7, Bm7(b5), E7, Am7, Bm7(b5), E7, Am7, Bm7(b5), E7, Am7, Bm7(b5), E7, Am7, and Bm7(b5). The second system (measures 17-32) features a sequence of chords: Bm7(b5), E7, Am7, Bm7(b5), E7, Am7, Bm7(b5), E7, Am7, Bm7(b5), E7, Am7, Bm7(b5), E7, Am7, and Bm7(b5). The melody is composed of eighth notes and quarter notes, with various arpeggio inversions and chromatic encircling techniques used throughout. Measure numbers 1 through 32 are indicated at the beginning of each measure.

THE LYDIAN II-V-I CADENCE

Unaltered, the Lydian II-V-I cadence is II7-Vma7-Ima7 (V7-Ima7-IVma7 of parent C major, G7-Cma7-Fma7). The Vma7 can also be I7, a secondary dominant that targets Ima7, making the cadence II7-V7-Ima7 (G7-C7-Fma7). See [“Secondary Dominant”](#), [“Modal II-V-I Cadences and Turnarounds”](#)/[Secondary Dominant](#) and [“Melodically Superimposed Cadences”](#)/[Secondary Dominants](#)

II7-V7-Ima7n (V7-I7-IVma7 of parent) chord and arpeggio example

Swing Sixteenths

The Lydian Family

Lydian mode

Lydian mode is major with sharp four or a major scale with the tone center on four. In the traditional manner, play a major scale up and down from scale tone four to four (F to F in C major). See Modes/Modes of Four Heptatonic Scales/major scale modes/[Lydian](#).

Lydian Dominant

Lydian dominant mode is major with sharp four and flat seven. It is mode IV of melodic minor (melodic minor with the tone center on scale tone four). Play a melodic scale up and down from scale tone four to four (F to F in C melodic minor makes F Lydian dominant). See Modes/Modes of Four Heptatonic Scales/melodic minor modes/[Lydian dominant](#).

Lydian Dominant as bII of Target

Lydian dominant is the classic [flat five substitute](#). It is a substitute for super Locrian with the same exact notes. Super Locrian, mode VII of melodic minor (B super Locrian as mode VII of C melodic minor) is a source for a super-altered V chord. See Modes/Modes of Four Heptatonic Scales/melodic minor modes/[super Locrian](#) and see "[Substitution](#)"/[Flat Five Substitute](#). Super Locrian contains the notes to include sharp five, flat five, sharp nine or flat nine in a seventh chord. It makes the most dissonant seventh chords. See [Lydian Dominant as Flat Two of I, IV or V](#) and [As Flat Two of Five In A Minor Key](#).

In the same melodic minor scale that contains super Locrian on its seventh step, the mode on the fourth step of melodic minor is an exotic, but much more consonant (less dissonant) than super Locrian. Using the same notes as super Locrian, but building a chord with its root on the fourth step of melodic minor Lydian dominant can be harmonized as a 13#11 chord.

Since the tones centers for Lydian dominant and super Locrian are a flat five (a tritone) apart from one another and share the same notes, they are used as the classic [flat five substitute](#).

Dorian Sharp Four

Dorian sharp four is equal to Lydian dominant with flat three. It is mode II of major sharp five and is mode IV of harmonic minor (See "[Modes](#)"/Modes of Four Heptatonic Scales/major sharp five modes/[Dorian sharp four](#)).

Dorian sharp four can be used as a darkened Lydian version when Lydian dominant is a key scale. It can also be combined with Lydian dominant by generally ascending from one to flat three with Dorian sharp four and generally descending from one to natural three with Lydian dominant.

Lydian Diminished

With its flat three and sharp four, Lydian diminished scale is an interesting scale, exotic and middle-eastern sounding. It contains both minor (major seventh) and diminished seventh chords built on its first step.

THE PHRYGIAN II-V-I CADENCE

Unaltered, the Phrygian II-V-I cadence is bIIma7-Vm7b5-Im7 (IVma7-VIIIm7b5-IIIm7 of parent C major, Fma7-Bm7b5-Em7). The Vma7 can also be V7#5#9, a secondary dominant that targets Im7, making the cadence bII7-V7#5#9-Im7 (Fma7-B7#5-Em7). See “[Secondary Dominant](#)”, “[Modal II-V-I Cadences and Turnarounds](#)”/Secondary Dominant and “[Melodically Superimposed Cadences](#)”/Secondary Dominants

bIIma7-V7#5#9-Im7 (Vma7-VII7#5#9-IIIm7 of parent) chord and arpeggio example

scale-tone chord	Fma7 XIII	B7#5#9 XIII	Em7 XII
chord name			
arpeggio	Fma9 XII	B7#5#9 XI	Em11b9 XII

THE LOCRIAN II-V-I CADENCE

Unaltered, the Locrian II-V-I cadence is bIIma7-bVma7-Im7b5 (Ima7-IVma7-VIIIm7b5 of parent C major, Cma7-Fma7-Bm7b5). Even using the bV as a dominant chord (IV7 of parent), this cadence is troublesome. With our current sensibility of tonality, this cadence is not successful in establishing the key on the m7b5 chord. It is difficult to establish a key with a tonic chord that has a flatted fifth *and* the interval from V to I in this cadence is not the traditional perfect fourth we know as a V-I cadence. See “[Secondary Dominant](#)”, “[Modal II-V-I Cadences and Turnarounds](#)”/[Secondary Dominant](#) and “[Melodically Superimposed Cadences](#)”/[Secondary Dominants](#)

Evolving Turnarounds to Sophisticated, Free-Form Melody

Turnarounds most typically represent chords that are played for two beats each with four eighth notes for each chord. These are important structures, but the listener can tire of them if they are not elaborated into more interesting melody.

In the early development of most jazz improvisers, they practice turnarounds, commonly on major II-V-I cadences, minor II-V-I cadences and other variants like I-VI-II-V, VI-II-V-I and III-VI-II-V. Most of these are chord progressions with roots moving in fourths, but many also involve [flat five substitutes](#) where IIIIm7-VIm7-IIIm7-V7-Ima7 becomes IIIIm7-bIII7-IIIm7-bII7-Ima7. See "[Substitution](#)"/[Flat Five Substitute](#).

At some point in his development, it seems Charlie Parker found standardized ways to apply flurries of notes on arpeggio tones in turnarounds, making them much more exciting to listen to. Along with that, he incorporated scale passages and skips to break up the arpeggios. Most of what he developed as his fast sophisticated melody on cadences is still based on arpeggios. To see his framework, you have to look at the elements, like the ambiguous use of different type of modal II-V-I cadences, bebop ornamentation with upper and lower mordents, turns and inverted turns (I call them upper turns and lower turns to be more descriptive), skips and flurries of scale in place of the passage between two or more arpeggio tones.

Once you can easily play up and down the scale, changing the note if necessary to make the second chord dominant and have gotten started with turnarounds, work on these four types of fast decoration on a chord tone:

1. Play an upper or lower *mordent* (chord tone, neighbor, return to chord tone), or turn. An *upper turn* (traditionally called a "turn") plays chord tone, upper neighbor, return to chord tone, lower neighbor, return to chord tone. A lower turn (traditionally called an inverted turn) plays chord tone, lower neighbor, return to chord tone, upper neighbor, return to chord tone.
2. Play a mordent or turn with scalar encircling: after the turn or mordent play the neighboring tone of the target triad tone for the next chord that is beyond the triad target tone, then play the target triad tone.
3. Play a mordent or turn with a skip to a neighbor of the target triad tone, then play the target triad tone. Skips should be less than an octave, usually a sixth or less.
4. Play a flurry of scalar tones beginning with a chord tone of the current chord and resolve to a note of the target triad. This may involve a few notes ascending or descending and may involve change of direction.

ornamentation at the eighth triplet, sixteenth and faster rhythmic levels

Flurries of ornamentation at the faster note levels can deviate more from the chord. This is common to baroque ornamentation and bebop ornamentation. The “fast” notes or flurries in bebop ornamentation, and other styles that use them is typically at least 500 notes per minute.

Flurries of notes occur in many styles and the same basic principles discussed here will apply to most. Examples of “flurries” are quick licks in blues, blues rock guitar, the fast ornamentation in celtic music; the highly ornamented phases in Indian ragas; the flurries in flamenco melody on the guitar and voice; the blurs of notes in Michael Schenker’s blues rock playing Alan Holdsworth’s and Frank Gambale’s jazz rock playing and John Petrucci’s progressive rock playing in Dream Theater. The list goes on, and that’s just guitar. There’s Art Tatum and Chick Corea on keyboards and Charlie Parker and Chris Potter on sax.

flat nine, eleven and flat thirteen on minor chords

Some upper chord tones don’t sound well when sustained. Most notably, these include flat nine (flat two) and flat thirteen (flat six) on minor chords and elevenths on major seventh type chords.

At the faster rhythmic levels (eight note triplets, sixteenth notes and faster), tones of a chord that would not be acceptable as a sustained chord tone can be treated as chord tones if they are melodically resolved. A flat nine or a flat thirteen (flat six) is not acceptable on a minor chord.

In a sense these unacceptable chord tones can be treated as neighboring tones to the tones of the target chord to which they will resolve. For each of the four modal II-V-I cadences shown on the following pages, I’ll show examples of this melodic tactic, inspired by bebop.

Changing Modal II-V-I Cadence Type between Chords

Using the “[Scale Ambiguity](#)” principle, the modal II-V-I type can be changed during a cadence. Usually such a change would involve a single changed note from the II to the V, either brightening by raising a note chromatically (b9 changed to 9, for example) or darkening (9 changed to b9, for example). The tendency is to darken by flattening a numbered tone if you’re going to a minor key on the target “I” or brighten by making a flattened numbered tone natural if you’re going to a major key on the target “I”.

It is common that more than one note is changed for the arpeggio and scale for the “I” chord when the target is “I” major (I major seventh), creating a surprisingly bright mood. The A section to How High the Moon is a good example of this. Notice that in bars eleven and twelve, G minor has been established as a temporary key, while the overall key is G major. The cadence at the end of bar twelve suggest going to G minor again, but surprisingly, bar thirteen is in G major. Along with the lyric “How High The Moon”, suggesting the bright, romantic moon, the G minor key has changed to the brighter G major key.

MODAL DOMINANT IMPROV STUDIES

Table of General Turnaround Studies

This will make use of chord roots progressing in perfect fourths, numerically VII-III-VI-II-V-I-IV-VII- etc. Play in a single position, starting with the E form area for tone “1” of the parent scale. Three of the numbers in the cycle create a modal II-V-I. If the target chord (key chord) is VI, VII-III-VI will make a “II-V-I” cadence in the key of VI, by renumbering it so “VI” becomes “I”.

After first experiencing the unaltered V of a particular target, the V may be altered to become a dominant seventh, except for target “I”, where it’s V chord is dominant without altering it.

For each target chord perform the six steps listed below, each with a live or recorded comping to play over. Start by basing the improv below on eighth notes at a moderate to fast tempo. You could also base your improv on sixteenth notes by halving the number of bars recommended below and using sixteenth notes instead of eighth notes, still playing them at the end of the setup chord.

1. In the position you intend on using for this series of six steps, play up and down the parent scale against an accompaniment of the target chord only (VI^m7, for example).
2. Play free improvisation on the “setup” chord (V of target) alone, without changing the parent scale.
3. Play free improvisation on the “target” chord alone.
4. In a repeating cycle, improvise on two bars of the setup chord (V of target) and two bars of the target chord, making a turnaround by playing four eighth notes of the setup chord at the end of its duration and four eighth notes at the beginning of the target chords duration. Tend to play throughout in the key of the target chord, except during the turnaround.
5. Create a II-V-I cadence, modally. If the target is a VI chord, use a VII chord as a II of VI and use a III chord as a V of VI. At first, don’t alter the parent major scale. Play over the same cycle as in step three (above) with two bar of setup chord and two bars of target chord, but make a three chord cadence by “back-cycling” in fourths to include a “II” chord before the “V” setup chord. During the second bar of the setup chord, play the four notes of the II chord followed by four notes of the V chord. In the first bar of the target chord, play four notes of its arpeggio or at least start with a tone of its triad and go into free improv during the target chord.
6. Play the II-V-I cadence as in step three, but change the V chord (setup chord) to dominant. II, III and VI minor chords are made dominant by raising their third from flat to natural. An unaltered IIm7 chord uses parent major scale tones 2-4-6-1, while its dominant version, IIm7, uses parent major scale tones 2-#4-6-1. Similarly, changing III^m7 to III7 sharps the five of the parent scale, or it can flat the six of the parent scale (making super Phrygian). Changing VI^m7 to VI7 sharps the one of the parent scale. Ima7 is changed to the dominant version I7 by flatting the seven of the parent scale. IVma7 is changed to the dominant version

IV7 by flattening the three of the parent scale. For VIIIm7b5, flat the three of the parent scale to make VII7 with sharp or flat five, sharp or flat nine.

Here is a table showing these steps:

	IIIIm7	VIIm7	IIIm7	V7	Ima7	IVma7	VIIIm7b5
V of target	VIIIm7b5	IIIIm7	VIIm7	IIIm7	V7	Ima7	IVma7
dominant V7 of target	VII7±5±9	III7	VI7	II7	V7	I7	IV7
scale for dominant V7	VII super locrian	III Phrygian dominant or III super Phrygian	VI Aeolian dominant	II Mixolydian	V Mixolydian	I Mixolydian	IV Lydian dominant
V dominant of target scale named as parent scale	I melodic minor	I major sharp five or I major flat six	I major sharp one (same as II melodic minor)	I Lydian	I major	I Mixolydian	I melodic minor
II of target	IVma7	VIIIm7b5	IIIIm7	VIIm7	IIIm7	V7	Ima7
II-V-I of target	IV-VII-III	VII-III-VI	III-VI-II	VI-II-V	II-V-I	V-I-IV	I-IV-VII

Using a flat five substitute, VII super Locrian as a V of III can be substituted with IV Lydian dominant, making the IV7 (IV13#11) a flat two of the target III. This is commonly done in jazz, beginning with bebop where the target “III” chord may be any quality with a fifth. So the target three may be a I type, V type, VI type or II type. See [“Substitution”/Flat Five Substitute](#).

the master round

Play on two bars of each chord in the cycle VIIIm7b5-IIIIm7-VIIm7-IIIm7-V7-Ima7-IVma7 (repeat). Use a moderate to fast tempo with an eighth note basis. Perform these three steps:

1. Play free improvisation on each chord, without modifying the parent major scale.
2. On beat three of the second bar of each chord, play a four-note arpeggio (or 1-2-3-5 or 1-3-4-5 on the triad on the root or third of the chord). This is the V of the next chord. On the first beat of the next chord, resolve to a triad tone of that next chord.
3. On beat one of the second bar of each chord, play a four-note arpeggio (or 1-2-3-5 or 1-3-4-5 based on the triad built on the root or on the triad built on the third of the chord) on the II chord of the next target chord. On beat three of the second bar of each chord, play a four-note arpeggio (or 1-2-3-5 or 1-3-4-5 on the triad on the root or third), making a V of the next chord.. On the first beat of the next chord, resolve to a triad tone of that next chord.
4. Repeat step three (above), but change the V chord to a dominant chord.

Table of Detailed Studies in Progressive Order

The studies shown in the following table, shown in the keys of C, F and Bb, focuses on changes of key scale type and pentatonic subsets. The chords and scales below reference the key of “C” as an example, by showing the letter names of the scales and chords in parenthesis as they would occur in the key of “C”. The two primary goals are:

- ✦ **Learn the chord changes.** Get intimately familiar with each of the chord changes and the options for scales. Then you can summarize those ideas when playing on quick chord I-VI-II-V chord changes.
- ✦ **Bebop ornamentation.** Learn to play the end of one chord and the beginning of the next chord each in arpeggio tones to make a turnaround. Then use bebop ornamentation on one or more notes in the turnaround in these four categories:
 1. a mordent or a turn
 2. a mordent or a turn followed by scalar encircling
 3. a mordent or a turn followed by a skip on the current arpeggio, then a resolution to the nearest triad tone of the next chord
 4. flurries of notes around each of multiple arpeggio tones, usually consecutive, but skips are good, too

LYDIAN DOMINANT AS bII OF I, IV OR V

In beginning our study of modal II-V-I cadences, we're looking at a substitute progression for V-I (G7 C). We're using a *flat five substitute*, employing a chord that is a flat fifth of V, in place of V. So, bII to I (Db7 to C) is a substitute for V to I (G7 to C). The "I" chord may be minor or major; it may be any chord quality that includes an un-altered fifth. It is possible to resolve to I chords with an altered fifth but takes careful preparation to make it work.

Develop this first by playing improvisation (especially arpeggio-based) on the chord that precedes the I chord and play four consecutive notes of the bII^{13#11} arpeggio immediately before the I chord. Play the bII^{13#11} arpeggio tones as the last four eighth notes or the last four sixteenth notes in the bar.

Voice-lead to the nearest triad tone of the I chord, its root, third or fifth. The more complex your improvisation, generally the more need there is for a straight-forward resolution, such as to the root triad. If you instead resolve to some other tone of the I chord, it will help to follow with another consecutive or two of the target I chord.

Starting our study with the bII^{13#11} to I is more colorful than V-I and is not *that* much more difficult.

THE PHRYGIAN FAMILY

Phrygian Mode

In relation to a major scale on the same tone center, Lydian mode is major with flat two, flat three flat six and flat seven. Modally, Lydian mode is or a major scale with the tone center on three. In the traditional manner, play a major scale up and down from scale tone three to three (E to E in C major). See “[Modes](#)”/Modes of Four Heptatonic Scales/major scale modes/[Phrygian](#).

Harmonic Minor

In relation to a major scale on the same tone center, harmonic minor scale is major with flat three and flat si. Modally, harmonic minor is mode VI of [major sharp five scale](#). Play a major sharp five scale up and down from scale tone six to six (A to A in C major sharp five makes A harmonic minor). See “[Modes](#)”/Modes of Four Heptatonic Scales/[major sharp five scale](#)

Phrygian Dominant

In relation to a major scale on the same tone center, Phrygian dominant is major with flat two, flat six and flat seven. It is mode V of harmonic minor (harmonic minor with the tone center on scale tone five). Play a harmonic scale up and down from scale tone five to five (G to G in C harmonic minor makes G Phrygian dominant). See “[Modes](#)”/Modes of Four Heptatonic Scales/melodic minor modes/Phrygian dominant.

Super Phrygian

In relation to a major scale on the same tone center, super Phrygian is major with flat two, flat three, flat four (equals three), flat six and flat seven. It is mode III of [major flat six](#). Play a major flat six scale up and down from scale tone three to three (E to E in C major flat six makes E super Phrygian). See “[Modes](#)”/Modes of Four Heptatonic Scales/melodic minor modes/super Phrygian.

ALTERNATE QUALITIES OF LARGE ARPEGGIOS

See “[Substitution](#)”/Alternate Qualities of Large Arpeggios.

Improv Level 4: Arpeggios

- **Chord-Tone Emphasis**
- **Establishing The Chord Progression In Time**
- **Melodically Superimposed Cadences**
- **Voice Leading**
- **Triad Arpeggio Solo Examples**
- **Seventh And Ninth Arpeggio Solo Examples**
- **II-V-I Turnaround Solo Examples**

CHORD TONE EMPHASIS

The primary objective is to emphasize chord tones on the accented parts of the bar, which are typically on the beat but may be established on other parts of the bar by accents that occur in the song. The melody should move by scale step, with two exceptions where you may skip within the range of a sixth: (1) within the tones of the current chord and (2) to a tone which is the upper or lower neighbor of the tone it precedes.

Preparation

Memorize arpeggios for the area first. Determine scales that could be used for each chord. It is preferable that sequences of chords share the same parent scale.

In-Position Arpeggios for the Chord Changes

Begin work on chord progressions of one or two chords per bar, as strict arpeggios are not so interesting when played for longer durations. First play in a strict vertical position (see [Playing in Position/Strict Vertical Position](#)). While this will not allow you to gravitate toward easier and more practical fingerings for some of the chords, it will greatly reduce the number of fingerings you will have to memorize to get started.

Ascend and descend arpeggios linearly. Whenever you reach the extent of the range, reverse direction. Play the chord changes for the song in eighth notes, triplets or sixteenth notes (whichever is appropriate). Look forward to [Voice Leading](#) for decision making in connecting arpeggios smoothly.

More advanced players may find it more productive to set this step aside, begin work with ninth arpeggios shown below, then return to work on the seventh arpeggios as they are often less interesting. Having spent some time with the ninth arpeggios, the sevenths would then be easier to work with (since they are the larger part of the ninth arpeggios).

Two Octave Ninth Arpeggios In Position

Ninth arpeggios can be ascended and descended much like the seventh arpeggios. When you ascend to ninth, you can take the option of descending to the root ("8", a scale step below the ninth) and begin ascending another octave from that root. For this purpose, practice ninth arpeggios in an overlapping fashion, as described below.

Two Octave Ninth Arpeggio Exercises. Choose a position and play ninth arpeggios for each chord in the song (unless restricted to a seventh chord by the chord type such as diminished seventh). Play an arpeggio for each chord in the chord progression once, to preview it.

When you can play two complete octaves of each ninth arpeggio in-position, ascend from the low octave root to the ninth, descend one scale step to the higher octave root and ascend the second octave of the ninth arpeggio. Range solutions:

- ✦ If you can't reach the low octave root, play that note up an octave.
- ✦ If you can't reach the high octave ninth, substitute the root for it.

Once you can play the chord progression in ninth arpeggios, begin to connect the chords with setup and target tones described below.

Study Subsets and Synonyms

With an awareness of the scale of which a chord is a part, you can determine subsets of the chord by thinking of any chord tone and recalling the scale-tone chord of which that note would be the root.

- ✦ Seventh chords (two seventh subsets to each ninth chord).
- ✦ Triads (three subset triads to a ninth chord, two subsets to a seventh or sixth chord).
- ✦ Thirds (most chords are stacked major and minor thirds).

Common examples of chord synonyms are: $\text{IIIm7} = \text{IV } 6$, $\text{IIIIm7} = \text{V6}$, $\text{VIIm7} = \text{I6}$, $\text{VIIIm7b5} = \text{IIIm6}$.

Working Structures into Your Improvisation

Develop fingerings for arpeggio figures as shown below with two versions for the root on strings 6, 5, 4 and 3 (sometimes only one version on string 3). Practice each type of arpeggio figures for a few minutes, then spend about twice that much time improvising with the figure. Learn to creatively and abstractly modify the figures during your improvisation.

Target Tone and Setup Tone

For the purpose of connecting chords smoothly, we need to consider how the last note of the current chord leads to the first note of the chord that follows. The current chord is the *setup chord* and the next chord is the *target chord*.

The general use of setup tones and target tones, can be conceived as used in bass lines. Move toward any chord tone of the target chord at the end of the setup chord with a scale tone above or below a tone of the target chord; or with a note that is the fifth of the target chord *if* it moves to the root. Setup tones don't have to be tones of the setup chord, but it is preferable.

ESTABLISHING THE CHORD PROGRESSION IN TIME

The Rhythmic Pulse Concept

Improvisational music is stronger in rhythmic than in harmonic (chordal) content. An improviser generally conceives a rhythmic idea, then puts a harmonic or scalar structure onto the rhythm. A major part of your study in improvising with arpeggio structures should be done with regular pulse groups such as four sixteenth notes per beat. You will then creatively and abstractly modify these later.

Begin in Step Time

Before playing with a regular tempo, build melodic figures in step time, counting to yourself which part of the beat you are on and stopping wherever necessary to think. Gradually play more regularly, until you are playing at a slow but regular tempo. Then, gradually accelerate the tempo.

Progressive Examples to Work Out Setup and Target Tone in Step Time

It is best to begin your study by limiting the range to approximately an octave, preferably on the smallest four strings.

- ✦ Linear arpeggios, full range. Insert scale tones for the setup tone where necessary.
- ✦ Linear arpeggios, abbreviating the range with an early change of direction.
- ✦ Arpeggios with internal skips (current chord tones only).
- ✦ Arpeggios with passing tones. Use the passing tones on the unaccented part of the bar.
- ✦ Arpeggios with neighboring and passing tones. Use neighboring and passing tones on the unaccented part of the bar.

Move from Setup to Target Tone Stepwise, with at Least Two Exceptions:

- ✦ Where the setup tone is the fifth of the target chord, moving to the root of the target chord.
- ✦ Using a pentatonic upper or lower neighbor in the interval of a minor third.

If you play 9 (=2) on the beat, it should be followed by the appropriate 7 (b7), to communicate the ninth chord. It wouldn't hurt to throw in the fifth after the seventh, either.

Develop an awareness of upper and lower neighbors that can decorate each chord tone, which may form a note group of three or four notes that could be interpreted as part of many scales or arpeggios (including seven and five tone scales. Ultimately, you will develop a melodic sense of decorating chord tones that supersedes scales and arpeggios. Melodic phrases don't have to be interpreted only in terms of a "scale" or "arpeggio" from which the tones came.

MELODICALLY SUPERIMPOSED CADENCES

When a section of a piece has original chord changes with one or more chords per bar, play arpeggios to represent the original changes (such as parts of the last four bars of Billie's Bounce) . Wherever a chord has a duration of over one bar, consider using melodically superimposed cadences. Cadences are also called *turnarounds*. Superimposed cadences are typically those with root movement in fourths, optionally with [flat five substitutes](#) for dominant seventh type chords. They can be practiced first in chords, then expressed with single-note melody. See [Melodically Superimposed Cadences](#), and [Level 4 Improv: Superimposed Cadence Examples](#).

Try to stay in the upper range, in lower positions play predominantly on the first four strings. During each arpeggio, when you run out of range, turn back and go the other direction. Don't play the highest or lowest note twice in succession. At the end of each arpeggio, move to a note in the next arpeggio up or down by scale step. Using stepwise voice movement from the last tone in one chord to the first in the next where possible. Insert a scale tone or chromatic where the last tone of one chord would redundantly be the same as the first note in the next chord.

For now, where the last note of the current chord is also in the next chord, you can progress to the next chord by a third (unless the common tone is a seventh of the next chord, where you can progress up to the root).

Improv on the tune in your existing style of improvisation. Add in one cadence, then another, etc.

MELODIC DEVICES

See the chapter, [Melodic Cells](#).

Resolved Beat and Unresolved Beat Figures

Resolved beat melodic figures are complete within the beat by ending the beat with a chord tone. They complete a chord sound within a beat.

Unresolved beat melodic figures end with a setup tone and are expected to resolve with a chord tone at the beginning of the next beat. Most of the melodic cells shown in [Melodic Cell Types](#) are unresolved beat figures.

).

VOICE LEADING

See the chapter on [Voice Leading](#).

Strict Chord Tones As Setup and Target Tones

Target tones are the chord tones of the next chord. Setup tones are those of the current chord. The note that is played last during the current chord is called the setup tone. A setup tone can be a scale tone above or below the target chord tone, as long as the interval is a minor third (one and a half steps or three frets) or less. Once you play a tone of the current chord, you can always move to other tones of the same chord. This is generally where you have the most freedom in playing skips (intervals larger than a scale step). The interval of a minor third occurs in 6/9 type pentatonic scales between “6” and “1”, in minor pentatonic scales between “b3” and “1”. Minor thirds also occur on chords built in harmonic minor and harmonic major scales which contain a minor third interval between scale tones “b6” and “7”. It is very useful to look at the setup and target tones for a pair of chords as sets of tones. Typical voice leading is shown below:

Chord Root Movement In Fourths

The tones on the fifth, seventh and ninth of the current chord will function as upper or lower neighboring tones of the target chord.

The root of and third of the current chord can function as a setup tone to a target chord's root.

Stepwise And Chromatic Chord Root Movement

The root, third and fifth of the current chord up or down to a tone of the target chord. When a chord root descends stepwise, its seventh may be the same note as the root of the target chord, in which case you should usually avoid redundancy by replacing it with another tone that would lead better to the target chord. The replacement tone could be an upper neighbor or the fifth of the target chord (especially if it moves up a perfect fourth to the root of the target chord).

Introduction To Harmony

Music is an expression, a form of communication (therefore, a language). It embodies agreement and disagreement, order and chaos. I typically listen to the instrumental content in a song and am initially oblivious to the lyrical content. I am amazed at others who have memorized lyrics to hundreds of songs (my friend Jim knows a thousand). When I eventually pay attention to the lyrics, I recognize that if the song was well written, there are parallels in emotional and expressive content in the harmony, rhythm and lyric. For example, in analyzing the chord progression to a song, I notice a cadence (chord change) that changes the minor (sad) key to major (happy) progressively over two bars of music. Then I read the lyrics for that section of music and notice the same emotional content and expression in the lyrics as in the harmony and rhythm.

When each melody note is harmonized by another note, a secondary melody is created. Additional melodies could be added so that with each melody note, a chord of three or more notes occurs. Each melody is considered a part, voice, or melody line. Imagine connecting the note heads for each melody in an arrangement with a written line on the music notation (a note head is the oval part of a note written in standard music notation). The line would illustrate a melody line. Each melody line constitutes a voice. The term voice comes from vocal arrangements where each person's voice would proceed through a melody line and create a part of the arrangement.

Voice Leading

The logical movement for each note to the next for each voice in an arrangement is called [voice leading](#). In studying the arrangement of chord tones of one chord moving to those of another, each note in a chord is called a *voice* and has a logical destination in the next chord. As a voice progresses through a number of chords, it creates a *voice path*. The study of the paths used by a number of voices is called *voice mapping*.

Harmonic Types Of Music

Monophonic music has a single melody line. *Homophonic music* has two or more melody lines, with all of the lines moving in parallel rhythmically, that is with no rhythmic individuality. Each part in homophonic music has the same number of notes as another part, each note occurring at the same time as a note in each of the other parts. *Polyphonic music* has rhythmic individuality for each of the parts, with some occurrences of a note in one part not accompanied by notes in all of the other parts.

Counterpoint is the study of note against note in a multi-voiced arrangement. The term comes from the Latin expression *punctus contra punctus*, which means point against point. Think of each note head in music notation as a point. The five species of counterpoint:

1. first species counterpoint: note against note.
2. second species counterpoint: two or three notes to one.

3. third species counterpoint: four or six notes to one.
4. fourth species counterpoint: two notes per melody note with syncopation.
5. fifth species (also called free or “florid” counterpoint): combination of the other species.

Major Scale-Tone Triad Voice Mapping

Since triads are very common and are subgroups of larger chords, it is very advantageous to know the nature of movement of their voices. The most useful voice movement is that where each voice moves to the closest available tone of the next chord. This conservative voice movement is easy for the ear to follow, whereas skips with intervals of a third or larger are generally harder to follow.

root moves up stepwise:all three tones ascend one scale step.

root moves down stepwise:all three tones descend one scale step.

root moves up a third: the root moves down a scale step and the third and the fifth stays the same.

root moves down a third:the fifth moves up a scale step and the root and the third stays the same.

root moves up a fourth:the third and the fifth move up a scale step and the root stays the same.

root moves down a fourth: ...the root and the third move down a scale step and the fifth stays the same.

Effective music has an interplay between predictability (comfort) and surprise (stimulation). Good improvisers can hear the chord quality another musician is suggesting (thinking). A great improviser can hear a repeating (looping) melody and play another melody with it, which creates a harmony for each note.

Cantaloupe Island Chromaticized Arpeggios Solo Example - solo

Sheet music for the solo example "Cantaloupe Island Chromaticized Arpeggios Solo Example - solo". The music is written in 4/4 time, key of F major (three flats), and features chromaticized arpeggios. The solo is divided into five measures, each with a corresponding TAB line below it.

Measure 1: Starts with an Fm⁹ chord. The melody is chromaticized. The TAB line shows fret numbers: 11, 8, 11, (11), 9, 11, 9, 10, 8, 10, 8, 8, 8, 8, 10, 8, 10, 8.

Measure 2: The melody continues with chromaticism. The TAB line shows fret numbers: 11, 10, 8, 10, 9, 8, 11, 8, 8, 8, 10, 11, 8, 11, 10, 10, 8, 9, 10, 9, 10, 8, 11.

Measure 3: The melody continues with chromaticism. The TAB line shows fret numbers: 11, 8, 11, 11, 9, 10, 9, 8, 10, 11, 9, 8, 9, 10, 10, 9, 10, 8, 11.

Measure 4: The melody continues with chromaticism. The TAB line shows fret numbers: 9, 10, 8, 10, 9, 10, 10, 10, 9, 10, 8, 11, 9, 10, 8, 10, 9, 10, 9, 11, 8, 9.

Measure 5: Ends with a Db⁹(#11) chord. The melody is chromaticized. The TAB line shows fret numbers: 9, 11, 11, 9, 11, 9, 8, 9, 8, 10, 9, 10, 10, 13, 12, 11.

Commonality Chords

- **Chord Synonyms**
- **What Are Commonality Chords?**
- **What Are Summary Chords?**

CHORD SYNONYMS

Chord synonyms are alternate names for the same group of notes played as a chord or as an arpeggio. See the chapter [“Chord Naming Conventions”](#).

Alternate Names for Complete Chords

Am7 contains the notes A-C-E-G. C6 contains the notes C-E-G-A. They contain the same notes, so they are chord synonyms. In terms of roman numerals, this can be shown in four pairs of chords built from a major scale, each pair involving a sixth or minor sixth chord. Here are the four pairs: I6 = VIm7, IV6 = IIIm7, V6 = IIIIm7 and IIm6 = VIIIm7b5.

every other scale tone

The common method of chord construction is every other tone of a major scale, or of another harmonizable seven-tone scale (harmonic minor, melodic minor and harmonic major). With seven-tone scales like the major scale, the letter cycle for this is F-A-C-E-G-B-D (repeat). Any three notes in the cycle (F-A-C) creates a triad, a chord with three different notes. F-A-C-F is three *different* notes. When applied to a chord or arpeggio in a musical part, any of the notes can be repeated.

Here is the C major scale in VII position, by letter name. Play the scale, ascending in alphabetical order from “C” to “C” for two octaves (CDEFGABCDEF GABC) from the “C” on the sixth string to the C on the first string and descending for two octaves (CBAGFEDCBAGFEDC) from the “C” on the first string to the “C” on the sixth string. To play a triad, play three notes in the every other note pattern, such as F-A-C. F-A-C is an F major triad. It can be played on strings five and four as a three-note arpeggio or on all six strings, as a complete F major arpeggio in VII position.

Notes in a triad or chord can be repeated. Both the three-note F major arpeggio and the complete VII position F major arpeggios are triad arpeggios, since they are made up of the three F major triad tones. The second row below shows many options of F triad chords, each with three different notes.

triads built in thirds from the tertian cycle

Every other note creates a series of *thirds*, since each note to the next in the every-other-note series is inclusively three notes. The C major scale in thirds is illustrated in the letter cycle C-E-G-B-D-F -A (repeat). Each major scale fingering can be divided into two sets of every other note. These two series of notes are each part of the letter cycle of thirds (C-E-G-B-D-F -A, repeat). They can be called the *tertian cycle*, a cycle made of thirds. Any three consecutive notes on one of the tertian cycles makes a triad (a tertian triad).

C major low
tertian cycle VIIC major high
tertian cycle VIIcomplete
C major scale VII

Any four consecutive notes on a tertian cycle makes a seventh chord (tertian quadrad). Here is a table of those triads for C major, with diagrams shown examples of five triads built from them, followed by diagrams of every arpeggio. The arpeggios combine notes from both tertian cycles and can be viewed in the complete C major scale.

shared thirds

“Shared thirds” involve a series of notes in the cycle of thirds that are common to two or more chords.

As you can see in the diagrams below, these pairs of chords share the same notes: Am7 and C6; Bm7b5 and Dm6; Dm7 and F6; Em7 and G6.

Both Am7 and C6 use the notes A-C-E-G, so they are *chord synonyms*. In C major, the VIm7 chord is A-C-E-G, a four-note set of every other note in the C major scale. In relation to the “A” major scale named after the root of the Am7 chord, A-C-E-G is 1-b3-5-b7. In relation to the “C” major scale named after the chord root of the C6 chord, C-E-G-A is 1-3-5-6.

Cma7	VII	Dm7	VII	Em7	VII	Fma7	VII	G7	VII	Am7	VII	Bm7b5	VII
		F6	VII	G6	VIII					C6	VII	Dm6	IX

See the [Chord Synonym Library/sixths](#).

ninth chords

Where the sound of the five note chord is acceptable, five notes in the cycle (F-A-C-E-G) creates a ninth chord (a tertian pentad or five note chord built in thirds). Here is a table of those triads for C major.

ninth chord	Ima9	IIm9	no chord	IVma9	V9	VIm9	no chord
ninth chord	Ima9	IIm9	n/a	IVma9	V9	VIm9	n/a
letter names	C-E-G-B-D	D-F-A-C-E		F-A-C-E-G	G-B-D-F-A	A-C-E-G-B	
parent scale tones	1-3-5-7-2	2-4-6-1-3		4-6-1-3-5	5-7-2-4-6	6-1-3-5-7	
numbered in C	1-3-5-7-2	1-b3-5-b7-2		1-3-5-7-2	1-3-5-b7-2	1-b3-5-b7-2	

Alternate Names for Partial Chords

Partial chords have indicated notes in their name that are omitted. C13 no 11, for example has all the odd numbers from 1 to 13, as a C13 does, but omits the eleventh. Bb9 no root has the same notes as Dm7b5 and Fm6, so all three are chord synonyms.

Chord Synonym Library

sevenths without a root

Cma7nr = Em		C7nr = E diminished		Cm7nr = Eb		Cm7b5nr = Ebm	
Em VII	Cma7nr VII	Edim. VI	C7nr VI	Eb major VI	Cm7nr VI	Ebm VI	Cm7b5nr VI

diminished sevenths and seven flat nine chords

The four notes of a diminished seventh chords divide the twelve half steps (one-fret intervals) of the octave into four equal minor thirds (three frets inclusively). From any note in a diminished seventh chord, there is another chord tone of the same diminished seventh chord a minor third above and another chord tone of the same diminished seventh chord a minor third below. Therefore, an entire diminished seventh chord or arpeggio can repeat up or down the fretboard in minor third (three-fret intervals).

Cdim7 = Ebdim7 = Gbdim7 = Adim7 = B7b9nr = D7b9nr = F7b9nr = Ab7b9nr							
Cdim7 X	Ebdim7 X	Gbdim7 X	Adim7 X	B7b9nr X	D7b9nr X	F7b9nr X	Ab7b9nr X
Cdim7 = Ebdim7 = Gbdim7 = Adim7 = B7b9nr = D7b9nr = F7b9nr = Ab7b9nr							
Cdim7 II	Ebdim7 II	Gbdim7 II	Adim7 II	B7b9nr II	D7b9nr II	F7b9nr II	Ab7b9nr II
Cdim7 = Ebdim7 = Gbdim7 = Adim7 = B7b9nr = D7b9nr = F7b9nr = Ab7b9nr							
Cdim7 VII	Ebdim7 VII	Gbdim7 VII	Adim7 VII	B7b9nr VII	D7b9nr VII	F7b9nr VII	Ab7b9nr VII

When a dominant seventh flat nine chord is played without a root (D7b9), the remaining notes are a diminished seventh chord. Since D7b9 without a root is F#dim7, 7b9 chords at three-fret intervals *without a root* would also be diminished seventh chords. Therefore D7b9 no root, F7b9 no root, Ab7b9 no root, and B7b9 no root are the same notes. Note this is only true when these four 7b9 chords are played without a root. This means there are eight synonym chords that share the same notes.

ninths without a root

WHAT ARE COMMONALITY CHORDS?

A commonality chord is a subset chord of usually three or four notes that are common to two or more chords. The chords they are subsets of usually occur consecutively. A minor (A-C-E), for example, is a commonality chord for Am, Fma7 (F-A-C-E), Dm9 (D-F-A-C-E) and C6 (C-E-G-A). The three notes of A minor (A, C and E) are common to all those chords.

Commonality chords are the basis of abbreviated chord progression and one of the bases of elaborated chord progression. See the chapter [“Abbreviating And Elaborating Chord Progression”](#). Chord progression can be elaborated by conceiving a number of chords that have a commonality chord in common or with the use of superimposed chord progression. See the chapter [“Melodically Superimposed Cadences”](#). Commonality chord types include literal, added harmony and changed-quality.

shared thirds

The most common cause of commonality chords is shared thirds, where the chords involved were build from the same cycle of thirds

6 1 3
4 5
2 7

The most common cause of commonality chords is shared thirds, where the chords involved were build from the same cycle of third, the *tertian* cycle. “Tertian” refers to a series of thirds. In full-tertian arpeggios, each note is a scale tone third from the next in a continuous series of every-other-note, using the numbered cycle 1-3-5-7-2-4-6 (see the circle at the left). They can build major scale-tone arpeggios constructed in thirds (every-other-note).

Two or more chords can share a series of two or more thirds in the cycle. A I major triad (C major with C-E-G) contains tones 1-3-5 of a major scale (C-E-G), while VIm7 (Am7 with A-C-E-G) contains tones 6-1-3-5 of a major scale. The I major triad and VIm7 triad share tones 1-3-5.

Literal Commonality Chords

With the literal type, the tones of the commonality chord are part of every chord to which they are applied, such as an A minor commonality chord (A-C-E) being part of the While My Guitar Gently Weeps verse chord progression Am (A-C-E) Am/G (A-C-E-G), D9/F# (D-F#-A-C-E) and Fma7 (F-A-C-E).

Added Harmony Commonality Chords

With the added harmony type, they are made to consist of common tones by adding one or more notes to one or more of the chords to create commonality. Applying an A minor triad as a commonality chord (A-C-E) to the first three bars of Sunny, Am7 (A-C-E-G), C7 (C-E-G-Bb), Fma7 (F-A-C-E) changes to Am7, C13 (C-E-G-Bb-D-F-A), Fma7, so the C chord includes the notes of A minor (A-C-E) like Am7 and Fma7 do. See [Substitution/Shared Thirds: Secondary Roots](#).

Changed Quality Commonality Chords

The changed quality type can be used on a jazz blues in Bb, for example by making a Bb minor triad (Bb-Db-F) common to the Bb9 (Bb-D-F-Ab-C), Eb7 (Eb-G-Bb-Db) and G7 (G-B-D-F) chords as follows:

- Bb7#9 includes Bb minor by changing the ninth to a sharp nine (Bb-D-F-Ab-C#, C#=Db).
- Eb9 (Eb-G-Bb-Db-F) includes Bb minor by adding the ninth (F) to Eb7 (Eb-G-Bb-Db).
- G7b5#9 includes Bb minor (Bb-Db-F) by adding a sharp nine (Bb) and a flat five (Db). G7 (G-B-D-F) already includes the needed “F” note.

For examples of alternate chord qualities, see the chapter [“Abbreviating and Elaborating Chord Progression”](#). For examples of Commonality Chords, see the chapter [“Voice Leading”/7362514 Common Tone, Common Tone II-V-I and II-bII-Id -II-bII-I and Common Tone Jazz Blues](#).

WHAT ARE SUMMARY CHORDS?

A commonality chord consists of three or more tones that are common to versions of two or more chords. When a commonality chord can represent the key of the song or the key of a section and can be part of most of the chords, it can be called a *summary chord*.

In a summary chord song, you can feature the tones of the summary chord by building themes around it and using scales and arpeggios that feature it. Knowingly or unknowingly, pop composers and improvisers create and perform chord progressions that take advantage of summary chords. If Am is the summary chord of a section of a song, you can largely “jam in A minor” during the section as if it is all an A minor chord.

Blues, R&B, funk, and most American pop music take advantage of the summary chord concept, making it easy for the listener to follow and predict the melody, basing the melody on a scale named after the summary chord.

See the chapter “[Core Melody on Triad Chord Progression](#)”.

Conceiving Many Versions of Chords

With a thorough knowledge of chord construction and chord types, you can consider each chord in a progression and the possibility of a proposed summary chord (usually a triad) for each of the chords in a progression. Spell each of the chords in the progression and consider the addition of the notes of the proposed summary chord. For each note of the summary chord, analyze what tone it would be in the chord you are considering and determine if that tone could be part of a currently acceptable version of the chord.

See [Chord Naming Conventions/Chord Qualities Not Currently Acceptable](#) and [Chord Archtypes](#).

songs with two or more summary chords

Songs sections often have a second summary chord for part of the section. The most common second summary chord is on the V chord of the key. More complex songs have more than two summary chords.

Core Melody on Triad Chord Progression

- **Summary of Procedures**
- **Modal Triad Songs for Core Melody Study**
- **Triad Chord and Arpeggio Fingerings**
- **One Core Melody Tone Per Chord**
- **Two Core Melody Tones Per Chord**
- **Three or Four Core Melody Tones Per Chord**
- **Full Elaboration**

SUMMARY OF PROCEDURES

- ✦ All within a range of a few frets, learn an arpeggio for each chord.
- ✦ **One core melody tone per chord.** Choose a chord tone of each chord that will lead to a note in the next chord by an interval of a fifth or less. Those are fundamental core melody tones. Duality tones that are common to many or all the chords are great to use frequently.
- ✦ Play the series of one core melody tone per chord over a backing track of the chord progression. Each note can be played repeatedly to study rhythmic words. See [Rhythmic Words and Comping/Melodic Rhythms Contents](#).
- ✦ **Two core melody tones per chord.** Add another tone during each chord, more often a chord tone of the current chord, but sometimes a neighboring tone or passing tone. Neighboring tones and passing tones should tend to be less emphasized by being of shorter durations and on rhythmically weak parts of the bar like the second and fourth beat in 4/4, the second beat in 3/4 time or on the offbeat.

In syncopated styles like bebop and funk, playing on the offbeat before a rest or sustain on the next beat is a “push” and has much the same effect as playing on the beat.

- ✦ Play the series of two core melody tones per chord over a backing track of the chord progression. Each pair of notes can be played with rhythmic words. See [Rhythmic Words and Comping/Melodic Rhythms Contents](#).
- ✦ **Three or four core melody tones per chord.** Add more chord tones and passing or neighbor tones. Begin to vary the rhythm with simple syncopation and phrase breaks. Learn the scales and their fingerings for key scales and chord scales.
- ✦ Play the series of three or four core melody tones per chord over a backing track of the chord progression. The series of notes can be played with rhythmic words, being careful to emphasize current chord tones. See [Rhythmic Words and Comping/Melodic Rhythms Contents](#).
- ✦ **Full elaboration.** Add melodic and rhythmic decoration to make a full elaboration, using notes of either:
 - ✦ a key scale that includes the notes of all the chords or of a chord scale for each chord (a scale named after each chord, like E major pentatonic on an “E” chord and A major pentatonic on an “A” chord).
 - ✦ or of a chord scale for each chord (a scale named after each chord, like E major pentatonic on an “E” chord and A major pentatonic on an “A” chord).

Include ornate decoration with upper and lower mordents, upper and lower turns, chromaticizing and bursts of fast linear scales or arpeggios.

MODAL TRIAD SONGS FOR CORE MELODY STUDY

Summary chord songs use chord progressions where a single chord sound predominates a chord progression. Here are Spotify playlists of *summary chord songs* in various modes:

- ✦ [major \(Ionian\) summary chord songs](#), based on a major chord
- ✦ [Dorian summary chord songs](#), based on a minor chord
- ✦ [Mixolydian summary chord songs](#), based on a major chord
- ✦ [Aeolian summary chord songs](#), based on a minor chord
- ✦ [Phrygian dominant summary chord songs](#), based on a major chord

Modal Triad Songs Are Depicted by Parent Scale

The modal triad songs in this chapter are depicted by parent scale, allowing a more unified concept of the chords involved, primarily using chords of parent major scales. Modal quadrad (seven and sixth chords) songs in the [Core Melody on Quadrad Chord Progression](#) chapter are depicted in the various key scales. Dorian in this chapter is conceived on step two of a parent major scale, while in the 'Quadrad' chapter Dorian is conceived as a key scale with the key on "1" of Dorian.

Major (Ionian) Triad Songs

The I major triad is common to I, IVma9, VIm7. The VIm triad is common to I6, IVma7, VIm7 and IIm9. Numbers shown after a slash are in the key of the chord root.

Amazing Grace - I-I-IV-I- I-VIm-II-V- I-I-IV-I- I-V-I-I

Getting Better - I-IVadd9-V-IVadd9

ONE CORE MELODY TONE FOR PER CHORD

Tones common to consecutive chords work great for core melody tones. Summary chord songs use chord progressions where a single chord sound predominates a chord progression.

TWO CORE MELODY TONES PER CHORD

THREE OR FOUR CORE MELODY TONES PER CHORD

FULL ELABORATION

Core Melody on Quadrad Chord Progression

- **Summary of Procedures**
- **Modal Quadrad Songs for Core Melody Study**
- **Quadrad Arpeggio Fingerings**
- **One Core Melody Tone Per Chord**
- **Two Core Melody Tones Per Chord**
- **Three or Four Core Melody Tones Per Chord**
- **Full Elaboration**

SUMMARY OF PROCEDURES

- ✦ All within a range of a few frets, learn an arpeggio for each chord.
- ✦ **One core melody tone per chord.** Choose a chord tone of each chord that will lead to a note in the next chord by an interval of a fifth or less. Those are fundamental core melody tones. Duality tones that are common to many or all the chords are great to use frequently.
- ✦ Play the series of one core melody tone per chord over a backing track of the chord progression. Each note can be played repeatedly to study rhythmic words. See [Rhythmic Words and Comping/Melodic Rhythms Contents](#).
- ✦ **Two core melody tones per chord.** Add another tone during each chord, more often a chord tone of the current chord, but sometimes a neighboring tone or passing tone. Neighboring tones and passing tones should tend to be less emphasized by being of shorter durations and on rhythmically weak parts of the bar like the second and fourth beat in 4/4, the second beat in 3/4 time or on the offbeat.

In syncopated styles like bebop and funk, playing on the offbeat before a rest or sustain on the next beat is a “push” and has much the same effect as playing on the beat.

- ✦ Play the series of two core melody tones per chord over a backing track of the chord progression. Each pair of notes can be played with rhythmic words. See [Rhythmic Words and Comping/Melodic Rhythms Contents](#).
- ✦ **Three or four core melody tones per chord.** Add more chord tones and passing or neighbor tones. Begin to vary the rhythm with simple syncopation and phrase breaks. Learn the scales and their fingerings for key scales and chord scales.
- ✦ Play the series of three or four core melody tones per chord over a backing track of the chord progression. The series of notes can be played with rhythmic words, being careful to emphasize current chord tones. See [Rhythmic Words and Comping/Melodic Rhythms Contents](#).
- ✦ **Full elaboration.** Add melodic and rhythmic decoration to make a full elaboration, using notes of either:
 - ✦ a key scale that includes the notes of all the chords or of a chord scale for each chord (a scale named after each chord, like E major pentatonic on an “E” chord and A major pentatonic on an “A” chord).
 - ✦ or of a chord scale for each chord (a scale named after each chord, like E major pentatonic on an “E” chord and A major pentatonic on an “A” chord).

Include ornate decoration with upper and lower mordents, upper and lower turns, chromaticizing and bursts of fast linear scales or arpeggios.

MODAL QUADRAD SONGS FOR CORE MELODY STUDY

Summary chord songs use chord progressions where a single chord sound predominates a chord progression. See the links to Spotify playlists of *summary chord songs* in various modes in the chapter [Commonality Chords/What Are Summary Chords?](#)

Modal Quadrad Songs Are Depicted by Key Scale

The modal quadrad songs in this chapter are depicted by key scale, allowing a focus directly on the mode, rather than thinking of it as a mode of a parent scale.

Modal trad songs in the [Core Melody on Triad Chord Progression](#) chapter are depicted in the various modes of parent major scales. Dorian in this chapter is conceived as a key scale with the key on “1” of Dorian rather than on step two of a parent maor scale.

QUADRAD ARPEGGIO FINGERINGS

These fingerings show the lowest complete octave of each arpeggio in black. The remaining notes shown in grey may be above, below or both above and below. Practicing the fingerings in rows or columns allows you to more quickly memorize the fingerings. As you move to the right in each row on this page, a sequence of flatted tones will occur: flat the seventh, flat the third, flat the fifth, double flat the seventh ("bb7" is the same tone as "6"). Any note of diminished seventh can be the root. This same sequence is shown with chord fingerings in [Chord Archetypes/Fingering Families of Seven Seventh Chord Types](#).

ONE CORE MELODY TONE PER CHORD

Tones common to consecutive chords work great for core melody tones. Summary chord songs use chord progressions where a single chord sound predominates a chord progression.

TWO CORE MELODY TONES PER CHORD

THREE OR FOUR CORE MELODY TONES PER CHORD

DUALITY TONES AND CORE MELODY

Duality tones are those notes that are both in the key scale and in the important current chord. Core melody is primarily duality tones. Exceptions include significant chromatics and upper and lower [appoggiaturas](#). See [Tonal Themes And Schemes/Improv Schemes And Comping/Duality Tones](#).

Duality Tones as the Chord Tone Part of a Scale

The chord tones of a particular chord that are part of a scale are duality tones when the scale is used to make melody and the duality tones are emphasized (brought to the listener's attention) in melody. The chord tones that are part of a scale could be called a subset of the scale. Here are links to some examples of such subsets:

- ✦ [“Pentatonic Fingering”/Triads and Pentatonic Scales](#) (the chords and arpeggios are subsets of the pentatonic scales),
- ✦ [“Scale-Tone Triads”/Triad Subsets of the Major Scale](#),
- ✦ [“Scales for Songs in All Keys”](#) (shows pentatonic scale subsets of major scales),
- ✦ [“Prime Scales, Chords and Arpeggios/Arpeggios and Their Scales](#).

Core Melody is Typically One or Two Notes per Bar

Core melody is usually one or two notes per bar. It's a skeletal structure. We'll often hear a core melody sung as a summary obligato behind a lead vocalist or instrumentalist in the background vocals or in an accompanying ensemble like a string or horn section.

All of the core melodic tones are in the key scale, like an A minor pentatonic scale. Most of them are also in the current chord, if it is an important chord. Some chords are short and transitional and are ignored. Rarely, an [appoggiatura](#) is used in a core melody, like Yesterday where a non-chordal tone is used that resolves up or down a scale step to a chord tone.

There can be many core melodies for any chord progression. It is very educational to de-construct existing melodies and determine their core melody. For any particular melody, knowledgeable improvisers would largely agree what the core melody with two notes per bar should be. For any chord progression a many core melodies can be written and many elaborations can be made on each core melody.

Great Improvisers Use Core Melody

Too often, improvised solos are just a bunch of fast scales and cool licks, but no melody. It better when you can remember something singable while listening to an improvisation.

How have great improvisers like Bach, Mozart, Beethoven, Bartok, Charlie Parker, John Coltrane, Keith Jarrett and Chick Corea spontaneously created good melody in improvisation? They learned a lot about chord progression, arranging, theme and variation. And about core melody.

Stimulation

Great melody provides ongoing stimulation for the listener at both the cell and phrase level simultaneously. It needs a balance between familiarity and innovation. It needs a timely balance for the specific listener(s) between the comfortable historical and the risky cutting edge of innovation. Great improvisers and composers like Bach, Beethoven, Louis Armstrong, Oscar Peterson, Chick Corea and Joe Pass found a way to timelessly balance the two.

Make your melody understandable. Punctuate. Memorize phases that lead into a particular chord like the II or VI chord. Be able to execute them flawlessly and know how to vary them. Make them understandable to the listener. Relentlessly keep the attention of the listener like Eddie Murphy in *Delirious* or Robin Williams in *Live On Broadway*. So, it's like comedic timing.

Again, the frequency of setup and target must be just stimulating enough. You have to control stimulation at the cell, phrase and section level. Memorize a lot of boilerplate stuff like licks and core melodies for common progressions. Develop spontaneous composition with them. Keep this subject in mind over the months and years and you'll get good at it.

Study the Four Layers of Core Melody

See [“Phrases Built with Core Melody, Cell Elaboration and Filler”/Build Tonal Layers Based on Core Melody](#).

CHORD TONES IN PENTATONIC SCALES

Finding Tones Common to Chords and a Pentatonic Scale

In rock, pop and blues guitar solos commonly use pentatonic scales. Usually a single pentatonic scale is featured, named after the key. This is called a *pentatonic key scale*. This makes it easy for the listener to predict much of what will be played, which is conducive to them liking it.

Important chords in the accompaniment which are also in the key scale are emphasized by being played louder, longer, more often, ending a phrase. Anything that will draw attention to them. This gives the music more depth and associates the accompaniment with the melodic line. Some chords in the accompaniment are not important and are not referenced with notes in the melody.

how to use the tables of diagrams on the following pages

On the following pages pentatonic fingering and chord commonality is shown. On each page, a particular pentatonic scale fingering is featured. Each fingering may be used for a minor key and for a major key. These are relative major and minor keys and would be played with the same exact notes, but establishing one note or another as the key, as shown by the circled notes on each of the two diagrams at the top of the page. On each diagram, all of the circled notes are the same notes in octaves.

The rest of each page shows elaborations of the scale as part of major scales and shows both the pentatonic part of the major scale and the chord parts of the major scale.

every diagram shows the same pentatonic scale fingering in bold black numbers

Notice that on each entire page, every diagram has bold black numbers in the same pattern as the two pentatonic fingerings at the top of the page. The numbers represent a major scale based on the number "1" in the diagrams. Each diagram in a row is a set representing a single major scale. Each row of diagrams can be played at any fret. The pentatonic scale would be named after the number reflected by the circles in the diagrams at the top of the page.

chords are represented for major scale tones one through six

Major scale-tone triads occur on each step of a major scale, each built with three notes in an every-other-note pattern such as 1-3-5, 2-4-6, etc. The major and minor chords built on steps one through six are commonly used, but not the diminished triad on step seven; so it is not shown here.

finding commonality: grey backed notes in bold black

It is your job to find notes for any chord that are also in the pentatonic scale and emphasize them during the chord. The notes with a grey background are the chord tones. The pentatonic scale tones are bold black. Simpler traditional chord progression is based on chords of a single major scale. Start with that. Find progressions for songs that use a single row.

In modern music, minor chords are changed to major. For the most part, the tones common to the key pentatonic scale and the chord are the same for the major and minor chord versions of the changed chord. Where it is not the same, the note from the minor version of the chord that is in the scale can remain and serve as an intentionally flatted blue note.

For example, House Of The Rising Sun is in the key of A minor. It uses primarily the A minor pentatonic scale for its melody and typical improvisation. House Of The Rising Sun uses the chords of the C major scale with the tone center on "A". The D minor chord in the C major scale is changed to D major, but this changes an "F" note to an "F#" note, and doesn't affect the A minor pentatonic scale. Also, the E minor chord of the C major scale is changed to E major. In this case, that changes a note in the A minor pentatonic scale: "G" changes to "G#". However, continuing to use the "G" note against the E major chord with the "G#" is acceptable as a "blue note", where the E minor sound is intentionally cast against the E major chord for a bluesy (dark mood) effect.

Intro To Pentatonic And Chord Commonality In C major, V position

start with A minor pentatonic, fingering 1

Let's start with the A minor pentatonic scale, fingering one in the fifth position and the C major scale. Learn these six arpeggios: C major, D minor, E minor, F major, G major and A minor. The diminished seventh triad built on the seventh step of the major scale is rarely used and should be ignored at first.

With the pentatonic scale well-memorized, contemplate one of the arpeggios in a range of three or four consecutive strings and, in your mind, determine which notes are common to both the pentatonic scale and the arpeggio.

pentatonic, major scale, arpeggios and common tones

In pentatonic-based melody on a chord progression. We should first study melody built on a single major scale, like the C major scale. We need an awareness of four fretboard fingering structures. The pentatonic scale, the major and the parent major scale (or other seven-tone scale), the major and minor arpeggios build on the scale and the notes that are in common with the pentatonic scale and the current chord.

the pentatonic scale

The pentatonic scale fingerings below are identical, except for the notes that name them. Like this pair, every pentatonic fingering has a relative major and minor tone center. Each tone center repeats in octaves.

E form m711 pentatonic

G form ma69 pentatonic

the major scale

The major scale is every note on the row of diagrams. Disregarding the grey backgrounds and the size of the notes, every diagram has the same numbered major scale pattern.

In all six of the diagrams below, the same pentatonic scale pattern can be seen as the notes with large black numbers, regardless of whether they have a grey background.

the arpeggios

The set of triads (three-note chords) below are all made up with notes of the notes of the C major scale. The major triads built on steps I, IV and V are C, F and G. The minor triads built on II, III and VI are Dm, Em and Am. In *any* major scale, the chords built on I, IV, V are major and those on II, III, V are minor. The diminished triad that occurs on step VII is rarely used and is omitted from this study.

Arpeggios for each of the triads below are shown with the grey-backed notes. Notice that all the notes of each chord above are part of the arpeggio for the same chord name below. Arpeggios can show *every* chord tone in an area of the fretboard, where there are sometimes two notes on the same string. Chord fingerings have one note per string.

pentatonic and chord commonality: core melodic tones

The tones that are both large black numbers *and* grey backgrounds are common to the chord and the pentatonic scale, as you can see in the diagrams above. These are the *core melodic tones*.

song examples

These songs can all be played in fifth position using either A minor pentatonic or C major pentatonic as a basis of improvisation.

House Of the Rising Sun (Am), Crossroad Blues (Am), From Four Until Late (C), Sweet Home Chicago (Am), D'Yer Maker (C), The Entertainer, (C) Cocaine Rag (Am), Nobody Knows You When You're Down and Out (C), While My Guitar Gently Weeps (Am), Don't Think Twice It's Alright (C), Hurricane (Am), Cowgirl in the Sand (Am and C), Let It Be (Am and C), Jam Man (Chet Atkins, Am), Ghost Riders in the Sky, (Am) Hey Hey My My (Am), John Barleycorn (Am), Moondance (Am), On Every Page (Am and C)

Applying to the Full Fretboard in All Keys

To be able to play core melody in all keys and all over the fretboard, you need to memorize four fingerings in each of five octave shapes: pentatonic scale, major scale, major arpeggio and minor arpeggio. Twenty things. You also need to know that major triads are built on steps one, four and five of a major scale and that minor triads are built on steps two, three and six. Then you need to determine the notes are common to both the pentatonic scale and the arpeggio on three or four consecutive strings at a time.

Core melodies can be made with pentatonic scales or heptatonic scales (like the major scale or harmonic minor) and with chromatics. Start with pentatonic scales.

See the next section: [Twenty Fingerings to Memorize](#).

CORE MELODIC TONES

Melody, Not Just Licks

Blues players commonly search for decades to find the “sweet” notes in building their licks. Song writers spend countless hours working at their craft, experimenting and trying to find good melody. Too often, they end up developing lots of licks and good technique, but they forget about melody. Great improvisers can create substantial melody in their improvisation spontaneously. How do they do it?

Its best to primarily create intuitively, through experimentation and interaction with other musicians. However, the process can be sped up if you learn something about the basis of good melody.

Good melody expresses a key for the listener, with a melodic line. The melody makes reference to important chords in the progression, so the listener could somewhat imagine the accompaniment even if the heard the melody unaccompanied.

They have a great knowledge of chord progression, arranging, building phrases and licks, theme and variation and they use a core melody. They think of the skeletal structure of their melody and fill in with their licks as they build a melody on a chord progression.

Core melody is usually about two notes per bar, uses primarily the key scale and is almost exclusively made with tones that are common to the key scale and current chord, or a version of the current chord.

The core melody tone might be an added harmony or altered tone in the current chord.

In developing their improvising in an intuitive manner, musicians accumulate a vocabulary of phrases and licks with which to make melody on a chord progression. As they anticipate the sound of each chord or chord group that will come up next, they audition themes (licks or motifs) in their memory, imagining the theme played against the chord progression. Part of this process has to do with chord sound and part of it has to do with rhythm.

Chord sounds can be emulated with scales by emphasizing one or more of the notes in the current chord. It is best if this is most often done with key scales, to retain the sense of key and therefore providing a unifying tonal center for the entire piece (or section) of music.

Core Melodic Tones Are Target Tones

Entire songs or at least sections of songs are typically in a single key, like A minor. Key scales are named after the key. Various types of key scales are used, usually to make each one better harmonize with the chord it is being used with, in the emotive style preferred by the player.

Core melodic tones are those notes that are both in the key scale and in the current chord. Improvisers may develop their craft for decades without consciously thinking about this. Through experimentation,

they find the notes that sound well with each chord. If they were consciously look for core melodic tones as notes both in the key scale and current chord, they would find the notes much faster.

major and minor triad arcs

On a graphic instrument like a fretboard instrument (guitar, bass, mandolin), they can memorize shapes that represent those notes. For guitarists, the basis of those shapes is the arcs of major and minor arpeggios and full-fretboard major scale tones.

Examples In A minor

Am pent V Am V C V Dm V E7 V Fma7 V G V

use notes in the bottom row for →
restricting the range to the first four strings
→
numbered in A

Am V C Dm, D Em, Em7, E, E7 F, Fma7 G

[Otherside example 1 video link](#)

Imagined Notes

Listeners can recall a song with varying degrees of clarity and “play the song back” in their mind. At least they could listen to the recording of song a few times, then stop it at a random point and still hear a few seconds of the part that follows in their memory. Try this with recordings.

If you hear the accompaniment to a blues in C without a “C” note, you’ll probably imagine the C note because of your familiarity with the chord progression. Play the chords below and try it. Strum once a beat in “Freddie Green” style (Count Basie’s guitarist). After playing it, play the sixth string, eighth fret “C” note and see if you were imagining it. It is the tone center we have heard in blues.

bar 1 I9 bar 2 IV9 bar 3 I9 bar 4 I9 bar 5 IV9 bar 6 IV7b9 bar 7 I9 bar 8 VI7

In our memory, each note we hear is kept in our short term memory, especially emphasized notes and notes that relate to something we have heard before. So the notes that are sustained in our short term memory effectively sound as chord tones.

Memories of core melodic tones are created by notes that leave an impression in the listeners memory, such as the last note in a phrase or a note that has been played at the beginning or end of a repeating figure, when the figure is repeated with the note omitted. It doesn't matter so much which instrument or voice is emitting each chord tone. Each note of the chord may be emitted by a different instrument or voice.

Adding Tones to a Chord

If a note is an appropriate addition to the chord, you can emphasize it and add it to the chord sound. If, for example the piano or guitar is playing an "A" major chord and the vocalist is sustaining a note which is the sixth of an "A" scale, the overall sound is "A6".

Find Scale Tones Common to the Current Chord

For each chord in a progression, determine which of key scale tones are also in the current chord, or are likeable additions to the current chord. Begin by learning to play a major scale named after the root of each chord through both octaves in the fretboard area where you intend on soloing. Learn which major scale tones or altered major scale tones will be needed for the chord on which you are improvising. Determine which of those chord notes are also in each scale you will use. Emphasize those scale tones and you'll be emulating the sound of the current chord.

A Summary Chord, Where One Chord Sound Works for Many Chords

See ["Commonality Chords"/What Are Summary Chords?](#).

Examples of Summary Chords

examples of chords a minor chord will work on

For one reason or another, A minor will work on all of these (see “this works by conceiving...”, below):

E minor will work on all of these (see “this works by conceiving...”, below):

D minor will work on all of these (see “this works by conceiving...”, below):

chords by number that can be represented with a minor chord

You can find b3 and 4 in pentatonic scales. Look at the minor pentatonic fingerings by number. The next two tones above “1”, the tone center are “b3” and “4”. Flat six is one fret toward the guitar body from “5”, or two frets toward the head of the guitar from “b7”.

by number	I	bIII	IVm	IV	bVI
in A minor	Am	C	Dm	D	F
in E minor	Em	G	Am	A	C
in D minor	Dm	F	Gm	G	Bb
in C minor	Cm	Eb	Fm	F	Ab

examples of chords a major chord will work on

For one reason or another, C major will work on all of these (see “this works by conceiving...”, below):

D major will work on all of these (see “this works by conceiving...”, below):

G major will work on all of these (see “this works by conceiving...”, below):

this works by conceiving other versions of the original chords

By thinking of other versions of the original chords with added harmonies or flatted notes, you can make a particular chord part of many chords.

In the diagrams below, you can see that Am is part of A7#9, C6, Dm9, D9 and Fma7.

In the diagrams below, you can see that C major is part of A7#9, C6, Dm9, D9 and Fma7.

using relative major and minor pentatonic

You may already know that each common pentatonic fingering can be used for a minor key and for a different major key. The scale can be used to represent the major and minor chords named after the keys that the scale is used for. C major and A minor pentatonic share the same scale tones. So, you could use the scale for either C major or A minor.

If you think of the scale in terms of the minor version (like A minor, C major's relative minor), you would tend to emphasize the minor chord part of the scale, making the mood darker. If you think of the scale in terms of the major version (like C major, A minor's relative major), you will emphasize the major chord part of the scale, making the mood brighter.

Minor pentatonic tone centers are indicated below with the rectangle (\square). Major pentatonic tone centers are indicated with the hexagon (\hexagon). Notice that when the major and minor tone centers are on the same string, the major tone center is three frets above the minor tone center (three frets toward the body of the guitar). In the same octave shape, the major pentatonic fingering number is one *higher* than the minor for the same tone center.

chords built on the third of the original

It is useful to determine which step of a major scale a particular chord was taken from. Study [Major Scale-Tone Triads](#), so you can do this. As part of that study, you would learn the cycle of thirds on which chords are typically built. It is shown below. The letter cycle involves one or more sharps or flats for every key except C major.

the seven number cycle of every-other number

the seven letter cycle of every-other letter

One every major scale tone, a three-note chord (triad) or a four-note chord could be built in thirds. For each of the four-note chords, excluding its root (the note after which it is named), a triad remains.

If you build a four-note chord on “5”, it uses numbers “5-7-2-4”. If you remove the “5”, 7-2-4” remains, which is the same as a triad built on “7”. Notice below that any seventh chord with no root is the same as a triad up a third (up two numbers). Ima7 no third is III minor.

Lettered examples below are for the key of C.

scale tone	triad	numbers	seventh	numbers	seventh, no root
1	I major (C major)	1-3-5	Ima7 (Cma7)	1-3-5-7	III _m = 3-5-7 (E minor)
2	II minor (D minor)	2-4-6	II _m 7 (D _m 7)	2-4-6-1	IV major = 4-6-1 (F major)
3	III minor (E minor)	3-5-7	III _m 7 (E _m 7)	3-5-7-2	V major = 5-7-2 (G major)
4	IV major (F major)	4-6-1	IVma7 (Fma7)	4-6-1-3	VI minor = 6-1-3 (A minor)
5	V major (G major)	5-7-2	V7 (G7)	5-7-2-4	VII dim. = 7-2-4 (B diminished)
6	VI minor (A minor)	6-1-3	VI _m 7 (A _m 7)	6-1-3-5	I major = 1-3-5 (C major)
7	VII diminished (B diminished)	7-2-4	VII _m 7b5 (B _m 7b5)	7-2-4-6	II minor = 2-4-6 (D minor)

chords built on the sixth of the original

using minor instead of major

Visualizing Notes of Each Chord in the Scale

Visualize the scale. Be able to see much or all of it in your mind, graphically on the fretboard. You can build this ability with multiple points of view. See [Devices To Memorize Pentatonic Fingerings, Scale-Tone Arpeggios and Pentatonics/Master Scale Pattern](#).

in your mind, overlay the chord on top of the scale

Not easy. Think in terms of three or four strings. Visualize the scale. Its very effective to visualize the scale in a limited range on the fretboard while playing an arpeggio of the chord in the same range.

Key Chord Sounds

With key chord sounds, the chord sound you are using represents a chord with its root named after the key, very often when the current chord root is a different note. For example, when playing in the key of A during a D9 chord (D9 has the notes D, F#, A, C and E), emphasizing the notes of an A minor chord, A, C and E works well, since those notes are in common A scales *and* in the D9 chord.

Think of the numbers of key scale tones that are also in the current chord. Find ways to relate to those tones in terms of a chord built on the tone center, such as 1-3-5 sounding “major”, 1-b3-5 sounding minor and “4” sounding suspended.

“1-3-5” - the major key chord sound

The major chord has tones “1, 3 and 5” of a major scale on the chord root. The distinguishing note is “3”. When combined in phrases with “b3”, the “natural 3” will predominate, making the chord sound more major and bright in mood than minor and dark or sad (bluesy).

“1-b3-5” - the minor key chord sound

The minor chord has tones “1, 3 and 5” of a major scale on the chord root. The distinguishing note is “b3”. Emphasizing “1, b3 and 5” of a minor pentatonic scale suggests the sad minor chord. The most important note in qualifying the minor chord is the “b3”. In blues, jazz and rock-related styles, the minor chord sound is commonly played against a major chord with the same letter name (E minor against E major, for example) to produce a bluesy effect. Used on chords such as I major or VI minor that have “natural 3” (I major has 1, 3, 5 of the key scale and VI minor has 6, 1, 3 of the key scale), the “b3” can be bent slightly as a “blue note”.

“4” - the suspended fourth key chord sound

Suspended fourth chords have tones “1, 4 and 5”. The distinguishing note is “4”. Emphasizing “4” creates a soft dissonance and need for resolution to a minor or major chord sound on the same root. The “4” - suspended sound is often used when “4” is not in the current chord to add a soft tension and need for resolution.

“b7” - the seventh key chord sound .

A few chords have “b7”, most commonly dominant seventh (such as C7) minor seventh (such as Cm7). Emphasizing the “b7” can serve as an added harmony for a triad, can create a soft tension and need for resolution. Used on chords such as V major that have “natural 7” (V has 5, 7 and 2 of the key scale), the “b7” can be bent slightly as a “blue note”.

“6” - the seventh key chord sound .

In western European folk music, American bluegrass, country and folk, “6” is commonly used as a secondary chord tone, not actually played by the chordal instruments, but emphasized in the melody. In those styles, the emphasis of the sixth is typically less than that of the triad tones.

In swing blues, country swing and swing jazz, the sixth is strongly emphasized in major and minor sixth chords and as part of thirteenth chords. It can commonly be used as a chord tone in most of the chords in a key, in those styles.

“2” - the ninth key chord sound .

Combined with the other notes in seventh chords, the ninth sounds colorful and jazzy. Used with a triad, it makes an add nine chord, which is modern-sounding. Minor ninths can suggest Asian culture.

Too often, improvised solos are just a bunch of fast scales and cool licks, but no melody. It's better when you can remember something singable while listening to an improvisation.

THE ARPEGGIO BASIS OF CORE MELODY

Improvised Melody Based on Triads and Larger Arpeggios

Play triad or larger arpeggios with the rhythms shown in [Sources of Melodic Rhythm](#) below. It's best to start with the one bar versions. Segue into those that start on the first beat (that excludes pickups and pushes) with a fragment pattern or chromaticized arpeggio figure.

Where there are sets of four notes within a melodic rhythm, consider making a chromaticized arpeggio figure. The four notes don't have to be continuous eighths or sixteenths, but too much sustain or rest time after chromatic notes can create too much dissonance.

Sources of Melodic Rhythm

See "[Rhythmic Words and Comping](#)"/[Comping Rhythms and Pop Song Themes](#).

one-bar melodic rhythms

[Charleston Family](#), all but the last two examples

[Evil Ways Family](#), all

[Reggae Family](#), all

Triple Time/[combining triplets and swing eighths](#). The interesting examples start with "Blues Power". The first few examples through "I'm a Man" are "keeping time" rhythms.

Triple Time/[triplets and swing eighths with a backbeat](#). The last two examples are a little interesting, but most are "keeping time" rhythms.

Triple Time/[Polyrhythmic Afro-Cuban](#). Somewhat "keeping time" rhythms, but interesting.

two-bar melodic rhythms

[Clave Family](#), all

[Bossa Nova Family](#), all

[Offbeat Family](#). Many examples are four-bar.

[Pop Song Themes](#). Most are two-bar, a few one-bar at the beginning, a few four-bar at the end.

two-bar melodic rhythms (including the pickup or push)

Pushes. Some have rests at the first beat, other have rest at the end of the bar.

Cadence Pickups and **Pickups** After the pickup to the first beat, most examples have rests from beat one or two on.

Sources of Arpeggio Tones

See “[Full-Fretboard Chord Tones](#)”.

start with a triad and a melodic rhythm, considering all these inversions

51		b51		#51	13	1b3				35	b35	b3b5	3b5	3#5

MELODIC DEVICES TO ESTABLISH CHORD TONES

Anything that draws attention to a note can help establish it as a chord tone. Even an exaggerated tone, such as wah-wah pedal down.

Appoggiatura

An appoggiatura (leaning tone) is an exception. Appoggiaturas create tension with a scale tone *next to* a chord tone, then resolve to the chord tone. In that case, the note the appoggiatura resolved to is the chord tone and the resolution is delayed until the chord tone occurs, when it *then* emphasizes the chord tone.

Metric Devices

Placing a tone on the beat suggests it is a chord tone. Placing a note immediately before the beat and not playing on the beat that follows the note is called a *push*. Pushes also suggest a chord tone.

Frequency

Playing a note frequently helps establish it as a chord tone. In the case of a pivot tone, every other note may be the same repeated note, which establishes it as a chord tone.

Tonal Devices

A series of notes like a scale or familiar melody can suggest leading to a particular note, even if it is not actually played. A chord progression may suggest a particular tone center, even if the tone center is not actually sounded in the chords, but suggested by the progression. For example, the jazz blues progression below suggests the key of "C", yet there is no "C" note. We just know the progression so well that we can imagine it.

C9 VII 3 b7 2 5 1 2 3 4	F9 VII 1 3 b7 2 2 3 4	C9 VII 3 b7 2 5 1 2 3 4	C9 VII 3 b7 2 5 1 2 3 4	F9 VII 1 3 b7 2 2 3 4	F7b9 VII 1 3 b7 b2 1 2 3 4
C9 VII 3 b7 2 5 1 2 3 4	A7#9 VI 5 1 3 b7 2 3 4	Dm7 V 1 5 1 b3 3 4	G13 VII b7 3 6 1 1 2 3 4	same as bars 7-8	same as bars 9-10

THE HARMONIC DENSITY OF MELODY

Three Densities Of Texture

Generally, in improvisation, use three densities of texture: quadrads, seven tone scales (or large tone arpeggios) and chromaticized arpeggios.

Low Density: Quadrads for Simple, Pure Chord Colors

Quadrads are four-note chords. They use four notes per octave. When playing in linear order of pitch, ascending or descending, they have just enough notes to express a chord color without it sounding like a scale. When larger arpeggios like ninths, elevenths and thirteenth are played, they have a less pure, more complex combination of colors.

It is common practice in this course to name pentatonic scales with chord names. Minor pentatonic is a minor 7/11 chord or arpeggio. Like large arpeggios, pentatonic scales have a less pure, more complex combination of colors and sound more like a scale than a chord, which is why they are called scales. The use of chord names for pentatonic scales in this course has the primary purpose of using the system of chord names (see [Chord-Naming Conventions](#)) to name pentatonic scales, since there many names have often been used by musicians and in music literature for the same pentatonic scale.

Use triads with neighbor to build quadrads. You can study this in [Fragment Patterns/Free-form triads with Neighbor Using Quadrads](#).

Medium Density: Seven Tone Scales for More Complex Scale and Chord Sounds

Seven-tone scales like the major scale and the twenty eight [modes of four heptatonic \(seven-tone\) scales](#). Seven-tone scales can be played linearly (ascending or descending by order of pitch), in [fragment patterns](#) or in large arpeggios by playing them in an every-other note sequence. See "[Chord-Naming Conventions](#)"/[Tertian Chords](#) and [All Scale-Tone Chords](#).

High Density: Chromaticized Arpeggios and Chromatic Scale for Dissonant, Thick Texture

Chromaticized arpeggios and chromaticized scales approach twelve notes per octave. With both of them, non-chord tones frequently occur on the beat or are otherwise emphasized making the music more dissonant because the lack of chord tone emphasis in the melody.

Alan Holdsworth used high density by chromaticizing scales and using substitute chord progression with distant relationships to the original chords.

THE ORDER OF MELODIC IMPORTANCE

Primary Structure in Order of Importance

root and fifth

Especially for the bass player, the most important notes are the root and fifth. So important that they are sometimes *not* played since they are so obvious that the listener can imagine them.

third and seventh (or other remaining tones of a quadrad)

The third and seventh are the most important coloring tones in music based on seventh chords like blues and jazz. They are the basis of a principle of most preferred tones to be voiced in chords or suggested in melody in blues and jazz: “the third and seventh (if involved) and any note mentioned in the chord name”. So a C13 chord would suggest the preferred tones 3, b7 and 6 (6 = 13).

chord coloring tones

Next are those added tones that color a basic chord. In triad-based music, this might be a second or a sixth. The coloring tones may be in the chord, like a sixth in C6 used in swing music. Or, it may be a sixth as used melodically in country or folk music on a major chord where the sixth is not actually played by the chording instruments, only played in the melody.

blue notes and exotic tones

Next in the order of importance are tones that further color the mood, more than standard colorations like an second, sixth or suspended fourth.

Blue notes that darken the chord or scale like flat three, flat five and flat seven are used to contrast the natural versions of the same numbered tones. Flat three is used to bluesify a major chord to contrast its natural three.

The blue notes, exotic tones like a major seven on a minor chord (Cm[ma7], 1-b3-5-7) or a sharp eleven in major nine sharp eleven also go further to define the subtle colors of a chord.

non-chordal scales tones

Next are the tones that are not implied to be in the chords, but are in the scale. They can be implied as non-chordal tones by not being sustained nor strongly emphasized. They may also not be expected as chord tones, such as not expecting a ninth in a triad-based style that typically doesn't use ninths.

chromatic tones

Last come the chromatic tones that come between scale tones as passing chromatics or precede chord tones from half step below. Passing chromatics fill with the note in between two scale tones a whole step (two frets) apart. Passing chromatics can also fill in larger intervals, playing every chromatic note from one chord tone to another, such as from flat three up to five.

Passing chromatics can also fill in every chromatic note in scale with minor thirds (tree fret intervals) or larger intervals. The minor third from flat six to natural seven in harmonic minor, for example, be filled in with both chromatic notes. The major third in a dominant seven eleven pentatonic scale (1-3-5-b7) from one to three can be filled in chromatically.

Chord Sounds with Pentatonic Scales

Pentatonic scales are usually based on arpeggios, so I use chord names to identify pentatonic scales. I call the common minor pentatonic scale with 21, b3, 4, 5 and b7 “minor seven eleven pentatonic” (m7/11). Using a chord names to identify the common major pentatonic scale with 1-2-3-5-6, I call it “major six nine pentatonic” (ma6/9).

seven eleven pentatonics

Minor 7/11, alias “blues minor”. The minor seven eleven pentatonic can be used for minor seventh key chord sounds.

7/11 (dominant 7/11), alias “blues major”. By change the “b3” to a natural third (“natural 3”), the common pentatonic scale can be used for bluesy major sounds.

six nine pentatonics

Major 6/9, alias “swing major”. The major six nine pentatonic can be used for major sixth key chord sounds. A fourth is very commonly added, making a six-tone scale of sorts, however the fourth is used more as a neighboring tone than in linear scale passages.

Minor 6/9, alias “swing minor”. By flatting the third (“b3”) of a major pentatonic scale, making minor six nine pentatonic (1-2-b3-5-6), you can get all the chord sounds of major six nine, but with minor instead of major. This works particularly well for theme and variation on I7 and IV7 chords, using the major 6/9 on the I7 chord and the minor 6/9 on the IV7.

For more information, see [“Pentatonic Fingering”](#) and [“Introduction to Improvisation”](#).

Chord-Scale Agreement

common examples

<u>chord</u>	<u>key-scale tones in chord</u>	<u>key scale</u>	<u>key-scale tones</u>	<u>tones in common</u>
Im7	1-b3-5-b7	minor 7/11	1-b3-4-5-b7	1-b3-5-b7
IIm7	2-4-6-1	minor 6/9	1-2-b3-5-6	1-2-6
IV7	4-6-1-b3			

Schemes of Key-Chord Sounds

Make up schemes of chord sounds in time line fashion by writing chord names on a single line and labeling the key chord sounds you will use below them. Keep it simple. Here are some samples:

Hideaway (blues in E) - E minor seven eleven key scale

E7 E7 E7 E7 A7 A7 E7 E7 B7 A7 E7 E7 B7

major b7 minor major b7 4 major 4

Five-Tone Chord Sounds with Ninth Arpeggios

Melodic Sense without a Specific Scale

the function of melodic tones

After detailed study of the emotive effect of each melodic tone by number in the context of tonal structures such as pentatonic scales and ninth arpeggios you will gain a sense of the melodic effect of each tone by number. You won't necessarily need to think in terms of a scale.

SCALE-CHORD MATCHING AND CONTRASTING

Recognizing the Scale that Matches a Chord

Keep increasing your knowledge of all the types of chords built on each step of a scale. See [“All Scale-Tone Chords”](#). Learn the modal structure of chord progression, so you can recognize groups of chords as having come from a particular scale. See [“Recognizing Scale-Tone Chords”](#) and [“Voice Leading”](#).

Superimposing Chord Progression

A secondary chord progression can be suggested. If it is logical and doesn't conflict with the primary chord progression, it can be acceptable to the listener. This does tend to produce momentary dissonances and tends to weaken the sense of key. Don't get so focused on the secondary chord progression that you lose the perspective that the listener will have in hearing both the primary (original) chord progression and the superimposed secondary chord progression.

See [“Melodically Superimposed Cadences”](#).

MODES AND HARMONY CHOSEN BY FEEL

By Feel First

Determine the emotive quality and genre of a phrase or section first. You'll learn which modes (scales), chords (harmony) and rhythms have dark moods, bright moods, angry moods, etc. and play something appropriate.

It's actually more important to get the mood right than the chord quality, scale type or rhythm. If the mood is right, the rest will be close enough. The more subtleties you can hear, the more you'll be able to choose the best scale and chord types in each situation.

The Emotive Qualities of Chords, Rhythm and Tone

Qualities of triads (major, minor, diminished, etc.) affect the feeling of a piece of music. Larger chords are sometimes complex, combining two or more triads and therefore combining multiple moods.

The rhythm can affect the mood. A fast tempo usually suggests a brighter mood and a slow tempo a darker mood.

Tone (timbre) affects the mood. Distortion sounds bold and brash. Soft chorused (the ambient effect) sounds feel calm.

See [Emotive Qualities of Chords and Scales](#).

The Emotive Qualities of Genre

Making reference to particular styles brings to mind whole sets of characteristic rhythm, chord quality and tone used in the style and the emotive qualities that go with it. Genres can even suggest a lifestyle or subculture.

Key Scales for Jazz Dominant Modes

We are using scales based on minor modes that occur on steps six and three of the major scale.

Aeolian key scale

This is the mode on the sixth step of a major scale. Playing the major scale from step six through six up and down suggests the new scale Aeolian. Think of it as a VI type.

harmonic minor key scale

This is the same as an Aeolian scale, but has a natural seven. It has a tone altered at near the top of the octave of A Aeolian.

Aeolian flat one key scale

This may seem odd, but it is very useful. The “flat one” tone functions as a “7” of the key and is part of the V chord, constructed with 5, 7 and 2 of the key. Think of this as having a tone altered at the bottom of the octave of Aeolian, the flat one.

Phrygian flat one key scale

This may seem odd, but it is very useful. The “flat one” tone functions as a “7” of the key and is part of the V chord, constructed with 5, 7 and 2 of the key. This is the same as Aeolian flat one, but also has flat two. Think of this as having two tones altered at the bottom of the octave of Aeolian, the flat one and the flat two.

Representing V-Type Dominant Chords

The preferred tones in voicing a V-type chord are the third and the seventh and anything mentioned in the chord name, like “13”, or any altered tone. The qualities are flexible. V type chords can be abbreviated (a ninth could be represented as a seventh) or elaborated (a seventh could be a thirteenth). A very common representation of a V-type chord is the harmonic minor type, where it is represented with a diminished seventh arpeggio that is a synonym to 7b9 no root.

Ambiguity and Differences with V-Type Modes

For example, 5-b6-b7-7 is common to both “super” modes (super Phrygian and super Locrian). Explore ambiguous melodic ideas that allow more freedom (in completing the scale) for the other players and for the listeners.

The bII Chord

Melodic minor mode VII generates the “Swiss Army” V7#9b9#5b5 chord. Modes are synonyms, and so are some chords they generate. Mode IV of melodic minor generates the chord 13#11. Most of the chords that are subsets of melodic minor IV13#11 are synonyms that are subsets of melodic minor VII#9b9#5b5. The basis of all the subsets is melodic minor IV7b5 = melodic minor VII7b5, which is the core of [flat five substitutes](#). See [Flat Five Substitute Chord Progression](#).

Swiss Army II in a Minor II V Cadence

bVI7 to V7 is fairly common, as in bars 9 and 10 of John Coltrane's "Mr. P.C." bVI7 to V7 can be thought of as a substitute cadence for the minor II V, where the bVI7 (melodic minor IV13#11 type) is a [flat five substitute](#) for IIm7b5 (melodic minor VII7#9b9#5b5, Swiss Army type).

Minor Mode Ambiguity

Key-scale tones b3-4-5-b6 (the middle range) are common to all four minor modes (Aeolian, harmonic minor, Aeolian b1, Phrygian b1).

Aeolian and harmonic minor vary the upper range

Key-scale tones 5-b6-b7-7 (the upper range) are common to both "super" modes on V of target.

Aeolian flat one and Phrygian flat one vary the lower range

Aeolian and harmonic minor have 1-2-b3-4-5-b6 in common (harmonic minor changes the 7). Aeolian b1 and Phrygian b1 have b3-4-5-b6-b7-1 in common (they change the 2).

the Aeolian/harmonic minor hybrid

Use the Aeolian/harmonic minor to both provide all the notes of V7#9 and creates a half-whole-half pattern at 5-b6-b7-7, like 7-1-2-b3. See ["Half-Whole-Half Cells and Diminished Scale"](#).

Commonly-Associated Sources of all the Key Emotive Tones

- 1 the tone center
- b2 Phrygian b1
- 2 Aeolian, harmonic minor, major, Mixolydian, Dorian
- b3 Aeolian, harmonic minor, Dorian
- 3 major, Mixolydian
- 4 Aeolian, harmonic minor, major, Mixolydian, Dorian
- b5 Aeolian b5, Dorian b5 (major b6 mode II)
- 5 Aeolian, harmonic minor, major, Mixolydian, Dorian
- b6 Aeolian, harmonic minor
- 6 major, Mixolydian, Dorian
- b7 Aeolian, Mixolydian, Dorian
- 7 major, harmonic minor, melodic minor

MELODIC CURVE ATTRIBUTES

Angle

Larger intervals grab your attention. Smaller intervals are smoother.

Contour

The contour is the shape of the melodic line, from linear and smooth to jagged with frequently-changing direction. Rapidly changing direction causes a jagged contour.

Syncopation and Change of Rhythm

Rhythm can define the contour of the melodic line. Syncopation can exaggerate the tension, as in the first three notes of Afternoon in Paris (followed by a smooth up-down-up-down weave). A change in the nature of the melodic rhythm can attract attention.

Harmonic Tension and Chord Color

Perfect and major intervals create less harmonic tension. Minor, diminished and augmented intervals create more harmonic tension. Non-chordal tones can create harmonic tension.

Each chord and region of a chord paints a mood. Larger chords are often complex with regions of varied mood. For example, 13#11 has bright major triad on its root, a dark diminished triad on its third, a sad minor triad on its fifth and an anguished augmented triad on its flattened seventh.

Theme Shapes

See the Theme Shapes section. For each song, read the melody in sheet music to see the specific implementation described. Then apply the same description to a different chord progression with supporting scales and arpeggios.

MULTIPLE DESIGN ELEMENTS AND THE EMOTIVE CURVE

Multiple Design Elements

The melodic attributes shown in this chapter are design elements of pitch, rhythm, chord quality, dissonance and consonance used on a time line, conceivable graphically. In “The [Emotive Curve and Sentiments](#)”, curves on a time line are discussed in terms of pitch, rhythm, dissonance, consonance and timbre.

Music is more inspiring and engaging when there are a sufficient number of design elements. In some styles, there are too few. In the late eighties much of the pop guitar soloing was fast with heavy effects, but with little diversity of design.

Pat Martino was a great player. He often played fast continuous sixteenth notes for long durations (many bars), without a diversity of other elements. At other times, he played with a diversity of design. You will probably find it most pleasing when he played a few bars of continuous sixteenths and periodically played vocal-oriented melody and other designs.

In J.S. Bach’s Brandenburg Concerto No. 3 in G major, he used much repetition of [fragment patterns](#) and [pivot tone](#), yet diversified regularly by changing design and by establishing chord regions with cadences.

Eric Johnson, B.B. King, George Benson, Joe Pass, Barney Kessel, Jim Hall, Paco De Lucia, Jimi Hendrix, Larry Carlton, Jimmy Page, and Jeff Beck have all shown a wealth of design elements and their improvisations benefit by it.

A Minor Diversity - [click to play video](#)

♩ = 105

The score is divided into three systems, each with a guitar staff (top) and a bass staff (bottom). The tempo is marked as ♩ = 105. The key signature has one sharp (F#).

System 1 (Measures 1-3):

- Measure 1: Guitar has a linear scale (F#4, G4, A4, B4); Bass has notes 6, 7, 9, 10.
- Measure 2: Guitar has a melody in vocal context (A4, B4, C5, B4, A4); Bass has notes 7, 9, 9.
- Measure 3: Guitar has a large angle arpeggio (A4, B4, C5, B4, A4) and a pivot tone (A4); Bass has notes 10, 7, 8, 7, 8, 7, 10, 10/12, 9.

System 2 (Measures 4-7):

- Measure 4: Guitar has a melody in vocal context (A4, B4, C5, B4, A4); Bass has notes 12, 13, 12, 12, 13.
- Measure 5: Guitar has a large angle arpeggio and triplets to signify chord change with change of rhythm (A4, B4, C5, B4, A4); Bass has notes 12, 17, 13, 15, 14, 15, 12, 12.
- Measure 6: Guitar has a melody in vocal context (A4, B4, C5, B4, A4); Bass has notes 7, 8, 7, 8, 7, 10, 10/12, 9.
- Measure 7: Guitar has a fragment pattern (A4, B4, C5, B4, A4); Bass has notes 12, 13, 15, 13, 12, 13, 12, 10, 8, 10, 8, 7, 8, 7.

System 3 (Measures 8-11):

- Measure 8: Guitar has a melody in vocal context (A4, B4, C5, B4, A4); Bass has notes 10, 10, 7, 10, 9, 6.
- Measure 9: Guitar has a linear scale (F#4, G4, A4, B4); Bass has notes 7, 6, 8, 7, 10, 12, 9, 9.
- Measure 10: Guitar has a melody in vocal context (A4, B4, C5, B4, A4); Bass has notes 10, 7, 8, 7, 8, 7, 10, 10/12, 9.
- Measure 11: Guitar has a melody in vocal context (A4, B4, C5, B4, A4); Bass has notes 10, 12.

ANGLE

During the same period of time, a greater interval creates a greater angle and mildly more tension.

An Octave To Grab Attention

An octave during a short period is catchy and attention-grabbing. The excerpt below from “B.B. Jump Blues” features an octave theme (three instances) with variation. [click to play video](#)

Swing Eighths

♩ = 140

Here's another attention-grabbing octave example. The excerpt below from “B.B. King Improv Study in G” features an octave skip in the next-to-last bar of the excerpt. [click to play video](#)

♩ = 148

Swing Eighths

Fifths In Blues Melody - [click to play the video](#)

Swing Eighthths

♩ = 120

A fifth is a moderately large interval and grabs your attention. In the Fifths in Blues Melody example below, the fifth from G to D is using during the I chord (G7), reminiscent of a field-holler (the vocal roots of blues melody). During the IV chord (C7), the root of the IV chord (4 of the key) is stated, then followed by ascend to the tone center (G), up a fifth. During the V7 chord (D7), the fifth of the key (D) ascends to the second of the key, suggesting both a ninth of the key (2=9) and the fifth of the V7 chord (A is the fifth of D7).

Linear Diatonic Notes Per Octave

Angles of Linear Diatonic Scales Versus Triad Arpeggios - [click to play video](#)

♩ = 120

Diatonic scales are those seven-tone scales including the modes of major, harmonic minor, melodic minor and harmonic major (28 modes). Played linearly up or down, fewer notes notes per octave are more jarring and attention grabbing. More notes per octave are smoother. In the example below, the ascending diatonic scales sound smooth and calm. The descending triad arpeggios are mildly jarring and grab your attention a bit more.

Angles of Linear Chromatic Scale Versus Triad Arpeggios - [click to play video](#)

♩ = 120

The musical score is written in 4/4 time with a tempo of 120 beats per minute. It consists of two systems of music. The first system contains measures 1 through 4, and the second system contains measures 5 through 8. Each measure features a single melodic line on a treble clef staff. Below the staff, there are three rows of numbers: T (Tonic), A (Arpeggio), and B (Bass). The numbers represent the sequence of notes in the scale or arpeggio for each measure. The first system starts with a C major triad (C-E-G) and a descending chromatic scale. The second system starts with an F major triad (F-A-C) and a descending chromatic scale. The numbers are as follows:

Measure	T	A	B
1	8 7 6 5	9 8 7 6	10 9 8 7
2	8 13 12 15 12 13	12 11 10 9	12 11 10 9
3	13 12 11 10 9	13 12 11 10	14 13 12 11
4	10 15 10 12 8	10 14	
5	10 9 8 7	10 9 8 7	11 10 9 8
6	10 10 8 13 8 10 6	8 12	10
7	8 7 6 5	9 8 7 6	9 8 7 6
8	9 8 7 6	10 9 8 7	10 9 8 7

A chromatic scale plays all twelve notes per octave. Unless particular attention is given to aligning chords tones of the current chord on the beat, a chromatic scale has a generally smooth effect though somewhat dissonant because of the five notes per octave that are not in the current seven-tone diatonic scale. In the example below, a descending chromatic scale is alternated with an ascending triad arpeggio. Like the comparison above with diatonic scales and triad arpeggios, the arpeggios grab your attention a little more and the chromatic scales are smoother.

CONTOUR

The shape of the melodic line, from linear and smooth to jagged with frequently-changing direction defines the contour of the melodic line. Rapidly changing direction causes a jagged contour, like the “A” section of “Afro Blue” or bars 5-7 of Billie’s Bounce.

Interval Size

A pair of notes span an interval. Consecutive notes create a series of intervals, making a [contour](#). Linear melody with small intervals has low tension. Large intervals are jarring and create more tension. Dissonant intervals like diminished fifth, augmented fifth and major seventh create more tension. Large and dissonant intervals such as a diminished fifth compound the tension.

Fragment Pattern Melodic Contours

[click to play video](#)

Textures created by the fragment pattern contours below are much more effective when mixed with other designs. See the Fragment Patterns chapter for more detail on fragment patterns and see the chapter Melodic Cells for all the other melodic designs.

HARMONIC TENSION AND CHORD COLOR

Harmonic Tension

Perfect and major intervals create less harmonic tension. Minor, diminished and augmented intervals create more harmonic tension. Non-chordal tones can create harmonic tension. Adding a non-chordal tone can introduce a pleasing, colorful harmony to an existing chord, in which case it becomes part of the chord, such as an added sixth or ninth.

Chord Color

Each chord and region of a chord “paints” a mood. Larger chords are often complex with regions of varied mood. For example, 13#11 has bright major triad on its root, a dark diminished triad on its third, a sad minor triad on its fifth and an anguished augmented triad on its flattened seventh.

THEME SHAPES

“Ain’t Misbehavin’”

section A - offbeat three-note weave, up a fourth or fifth.

“All of Me”

Three descending notes with eighth note syncopation, quarter note triplet three-note weave as a pickup to another three descending notes with eighth note syncopation.

“All the Things You Are”, bars 1-8 and 9-16

Two notes with long duration ascending a fourth; twice: a repeated note followed by another ascending fourth; resolve down.

“Angel Eyes”

Ascend a fifth, then descend immediately to the dark flat fifth; descend to interplay the flat third and root; ascend and descend the key minor ninth including a skip of a fifth from the fifth to the ninth (1-b3-5-9-root-5).

“Another Star” section A

Ascend minor root to fifth in quarter note triplets, starting on the second triplet note; scalar weave down to the root. Repeat except end with a weave down to flat three and up to five.

“April In Paris” section A

Three times: repeat a note in a quarter-note triplet, followed by scalar encircling to the next lower scale tone. Ascend to a chord tone by thirds.

“Autumn Leaves” section A

Four times: ascend three scale tones, then ascend a fourth.

“Bags’ Groove”

(1) sustain the key scale fifth; (2) play the key scale fourth, its lower neighbor, then the fourth; (3) the key scale flatted third, its lower neighbor then the flatted third; (4) the key scale tone center, its lower neighbor then the tone center; (5) end on the key scale flatted seventh to create a mild tension.

“Begin the Beguine”

Repeat this design, as you see on the sheet music: quarter note triplet with chord tone ascending to passing tone then the next higher chord tone, use scalar encircling to a lower chord tone of the same or of the next chord.

“Chitlins Con Carne”

With pivot tone and a little syncopation, the Chitlins Con Carne melody has a jagged design, not too jarring. Use key scale 1 as a pivot tone, ascending to b3, 4, then sustain 5, pivot 1 to b3; then pivot tone 1 to b3 and 4 again. Repeat. Play a third time, but instead of sustaining 5, pivot to 5 and sustain b7.

“Confirmation”

Two-note core melody with skips and syncopation.

“Days of Wine and Roses” section A

Beginning with a long, rolling key major pentatonic melody, followed by a two-chord-tone pickup to each chord, when the second note is an anticipation repeated at the beginning of the chord and descending a fifth. Section A ends with a rolling major pentatonic then key major scale melody, ending on 2.

CORE MELODIC RHYTHM

Separate from the pitch design components of melody, there is a simple rhythmic basis of melody. This could be called the core melodic rhythm. You can learn to identify it by pursuing the rhythmic foundation in the endless repertoire of music. Once you get a sense of the nature of core melodic rhythm and use the concept to compose and improvise your own melody.

Attributes of Core Melodic Rhythm

These attributes can contribute to core rhythm status for notes and places in time:

- ✦ the one, two or three rhythmically most important locations in time in bar
- ✦ rhythmic locations used by many instruments (or voices) in the arrangement
- ✦ notes that stand out because of accent, skip to a high pitch or change the scale
- ✦ a harmonic change note that sharps or flats a note in the parent scale
- ✦ a note of a familiar theme, even if only hinted

Identifying Duality Tones

Notes common to both the current scale and the current chord are duality tones. This can be arbitrary, since there are usually options for both the current scale and the current chord.

Reverse-Constructing Core Melodic Rhythm

Once determined, a core melodic rhythm can be elaborated in many ways to make melodies.

Elaborating the Core

The core melodic rhythm can be elaborated with many rhythmic devices, including pickups, pushes and syncopation, serial repetition and anti-metric grouping.

Filling in Around Core Melodic Rhythm Phrases

“Breaths” (sustains and rests) between phrases of core melody rhythm can be replaced by rhythmically regular (continuous pulses) or irregular linear or non-linear scales, arpeggios. The “filler” may use fragment patterns, melodic devices and ornamentation. See [“Fragment Patterns”](#), [“Melodic Cells”](#) and [“Core Melody with Baroque-Bebop Ornamentation”](#).

RHYTHMIC WORD IMPROV

**Link this [Rhythmic Word Improv playlist](#) on Youtube
with over 40 hours of guitar, bass and drums**

Each page of examples features a particular rhythmic word, so you can build auditory memories of them to use in improvisation. They are in all keys and wide range of positions from the third to fifteenth. They also cover a wide range of styles. In most cases, each examples is played four times.

Rudimentary Guitar Rhythms with Rhythmic Words

These rhythms are presented in monotone pitch. The exceptions are upper and lower mordents, where a mordent is implied involving an upper or lower neighboring tone.

multitasking pitch and rhythm

With one bar at a time, your goal is to get a rhythm in mind and play it in various parts of the scale or arpeggio on the fretboard, in various fingerings. This is a very useful skill.

The first instance in A Dorian is shown in notation here, along with a link to see and hear it. You will need to audition it and focus on one bar at a time. Other instances are shown with links to videotab only and their links are shown below *after the A Dorian version*.

rhythmic words

Each study features one rhythmic word, such as “all four” or “gallop”. These exercises can train you to use a variety of rhythms. See “[Rhythmic Words and Comping](#)”.

mordents and turns

Sixteenth triplets are frequently shown, which imply an upper mordent (not, hammer, pull-off) or a lower mordent (note, pull-off, hammer). Turns are shown with four thirty second notes (three beams).

Afro-Cuban

Measures 147-159. The notation is in treble clef with a key signature of one sharp (F#). It features a series of eighth notes and triplets. Brackets below the staff indicate groupings: three eighth notes grouped as a triplet, and groups of four eighth notes. Rehearsal marks are present at measures 147, 151, 155, and 159. The tempo is marked as ♩ = 140.

♩ = 140

3 of 3

Measures 163-178, 3 of 3. This section consists of four staves of music in treble clef with a key signature of one sharp (F#). The tempo is marked as ♩ = 140. The notation includes various rhythmic patterns, primarily using eighth and sixteenth notes, with many measures containing triplets. Rehearsal marks are present at measures 163, 167, 171, and 175. The first three staves each have four measures, and the fourth staff has four measures. The notation is complex, with many measures containing triplets and repeated patterns. The first staff has measures 163-166, the second 167-170, the third 171-174, and the fourth 175-178. The notation includes many triplets and repeated patterns, with some measures marked 'play 4 times'.

♩ = 140

2 of 3

Measures 179-191, 2 of 3. This section consists of four staves of music in treble clef with a key signature of one sharp (F#). The tempo is marked as ♩ = 140. The notation includes various rhythmic patterns, primarily using eighth and sixteenth notes, with many measures containing triplets. Rehearsal marks are present at measures 179, 183, 187, and 191. The first three staves each have four measures, and the fourth staff has three measures. The notation is complex, with many measures containing triplets and repeated patterns. The first staff has measures 179-182, the second 183-186, the third 187-190, and the fourth 191. The notation includes many triplets and repeated patterns, with some measures marked 'play 4 times'.

Am¹¹

SYNCOPIATION AND CHANGE OF RHYTHM

Once the meter (beat) has been established, contradicting it by playing on the offbeats (syncopation) can grab the listener's attention. *Consistently* playing syncopated notes on the offbeats becomes less compelling and draws less attention.

A change in the nature of the rhythm can draw attention. Rhythmic theme and variation can first establish a repeating rhythmic theme, then change it to attract attention. A change of section, such as from the end of a verse to the beginning of a guitar solo, can be underscored by a change of rhythm in changing from eighth notes in the melody to quarter note triplets.

"JAZZING" THE LINE

Melodic Curve and Melodic Line

The melodic line is a conceptual line that connects the notes of a melody on a timeline. The melodic curve is essentially the same, but refers a bit more to the contour of the melody.

Jazz melody includes these attributes: dissonant intervals and chords, syncopation (off-beat rhythm) and chromatics. The dissonant intervals and chords express the oppression of slavery, the syncopation comes from African rhythm and the chromaticizing comes from middle eastern and eastern European music that influenced African-American musicians through their study of classical music.

During slavery, African Americans heard music publicly in marching bands and less often in classical music performance when they were part of the staff servicing the performance. They were allowed to play military band instruments such as the fife (Portuguese flute) and marching drums. Rudimentary rhythms taught to military percussionists were adapted by slaves and mixed with the syncopation of African rhythm.

Bugle Calls with Darkened Chords, Syncopation and Chromaticizing

The bugle plays only the notes of a single major chord. There are bugle versions with F, G, C and Bb major. Bugle is always written in "C" major. It can be quite insightful to hear U.S. Army bugle calls (bugle melodies used as alerts) modified to include the attributes of jazz applied by African American jazz musicians: darkened chords, darkened scales, syncopation and chromaticizing. You can hear the evolution of jazz.

Listen to some of the darkened, syncopated and chromaticized bugle calls and try to modify one of the original bugle calls in the same manner yourself.

U.S. Army bugle calls with darkening, syncopation and chromaticizing

Each bugle call below is shown in its original version, followed by the "jazzed" version. Imagine the jazzed version played by Louis Armstrong on trumpet.

The musical score consists of three staves of music. The first staff is in 4/4 time and begins with a treble clef and a key signature of one flat (B-flat). It contains measures 223 through 230. The second staff begins at measure 231 and continues to measure 234. The third staff begins at measure 235 and continues to measure 242. The music features various rhythmic patterns, including eighth notes, quarter notes, and sixteenth notes, as well as rests and triplets. The key signature changes to two flats (B-flat and E-flat) at measure 231. The score concludes with a double bar line at the end of the third staff.

Theme and Variation

- **Harmonic Theme and Variation**
- **Rhythmic Theme and Variation**
- **Hooks**
- **Melodic Curve Exercises**
- **Theme and Variation Songlist**

HARMONIC THEME AND VARIATION

Themes that are modified to fit each chord, changing versions of numbered tones and/or substituting adjacent scale tones to cause matching.

The Melodic Curve

A melodic curve has two components: pitch and time. To conceive a melodic curve, imagine a phrase written in standard music notation with all of the elements of notation omitted except the oval note heads and the relative spacing of the notes vertically and horizontally. Now imagine an alternate system of notation on grid paper, where each grid space horizontally represents a half a beat (or some regular part of a beat) and the each grid space vertically represents a half step (an interval of one fret).

Harmonic Variation

First imagine harmonic variation by playing a melodic line on one chord, then applying it to another chord. Usually, the notes that were chord tones of the first chord should also be chord tones in the application of the melodic curve on the second chord.

The character of each chord needs to be established appropriately. When a theme played previously on a C major chord is nearly identical with its application to an A minor chord, it can help to change the scale to A harmonic minor to dramatize the sadness of the minor chord. When given the option of using a major sixth or major seventh on a major chord in a swing blues tune, you would probably choose the sixth, since the sixth chord is more common to that style than a major seventh chord.

Retaining The Range Of Pitch Or Not

It is generally easiest to hear melodies using harmonic variation when the phrases for each chord retain a given range of pitch. It can be interesting to jump around in range also, yet that requires a more obvious statement of each chord, since the listener is being distracted by the changes of range.

Two or Three Significant Parts

The listener can only process two or three significant musical parts at once. If you overburden the listener with too many different rhythmic or harmonic ideas at once, they won't understand your music and probably won't like it.

some parts are just background

Some musical parts don't require the attention of the listener and are part of the textural background. These parts tend to be more regular and just "keep time".

notable parts need to be distinctly the same or distinctly different

Musical parts that stand out to the listener should be few in number. If there are more than two or three notable parts, some of them should be made similar enough to be considered a single idea to lessen the number of different notable ideas.

RHYTHMIC THEME AND VARIATION

See [Rhythmic Themes and Layers](#).

Rhythmic Selection From A Regular Pulse

Rhythms are traditionally selected from a regular pulse that represents the beat.

“air guitar” strumming while speaking

Start by moving your hand in the air, in evenly-timed sets of down-up-down-up. The hand should move very regularly like a metronome or pendulum. Speak the selections you intend to make of each set of four. Start by speaking “down-up-down-up”, and “1-2-3-4” alternately. Gradually touch the strings and strum a single chord.

Now repeat the procedure for gallop. Speak the selections you intend to make of each set of four. Start by speaking “down-(miss)-down-up”, and “1-um-3-4” alternately. Gradually touch the strings and strum a single chord. You should be missing the strings on the first “up”, which is “2”

Syncopation

Syncopation is the emphasis of notes not on the beat, followed by either a sustain onto the next beat (most often written with a tie), or a silence on the next beat (a rest). Sustain syncopation sustains onto the next beat, while rest syncopation is followed by a rest on the next beat.

Rhythmic Words

Conceived primarily in terms of three or four pulses per beat, rhythmic words constitute all of the possible selections from those parts of the beat. All of these should be progressively memorized, beginning with those rhythmic words that have no rests (silences). There are eight four pulse rhythmic words without silences and four three-pulse rhythmic words without silences. See [Rhythmic Words and Comping](#)

The Rhythmic Theme

While a melodic curve has the two components of pitch and time. Rhythmic themes may seem simpler, but they have many subtle components. Rhythmic themes have a relation to the meter (beat). They involve selection from a regular pulse, rhythmic words and rhythmic concepts, such as syncopation, pickups and polyrhythm. See [Rhythmic Words and Comping/Melodic Rhythms Contents, Building Melodic Rhythms](#) and [Comping Rhythms Contents](#).

Metric Placement And Beat Subdivision

Rhythmic themes are placed in time in relation to the beat. Meter is the regular structure of beats in units, such as four beats to the measure (bar and measure mean the same thing). You, the other musicians and the audience all need to be imagining the same regular pulse and its subdivisions. In duple time, beats are subdivided into two parts: there are two equally spaced pulses on each beat called the downbeat and upbeat. In triple time, beats are subdivided into three parts: there are three equally spaced pulses on each beat. In swing time, there are three parts per beat conceptually, but you focus on hearing the first and third parts of each beat.

Pickups and Pushes

Pickups involve groups of notes rhythmically located immediately before the first beat of a chord (most commonly where the first beat of the chord is on the first beat of the bar). They can be regular, such as four sixteenth notes, or irregular, such as a combination of eighth and sixteenth notes. In common time (4/4), sixteenth notes are a quarter beat each and eighth notes are a half beat each.

anticipating the next beat

Pickups and pushes both anticipate the next beat by playing something at the end of the previous beat.

progressive eighth pickup exercise

Swing Eighths

♩ = 120

1 2 3 4 1 2 3 4 1 2 3 4 1 2 3 4 1 2 3 4 1 2 3 4 1 2 3 4

5 3 5 5 3 5 5 5 3 5 5 5 5 3 5 5 5 5 3

play 4 times

pickup

In the example below, four beats are each divided into four parts, making sixteenth notes in 4/4. The four sixteenth notes on each beat are labeled in the row “sixteenth-note counting”. The fourth division of the second beat, labeled “a”, anticipates the third beat. This is called a *pickup*.

pickup to beat three

strum/pick	↓				↓				↑	↓						↓
selection	1				2				a	3						4

full groups of four 1 e + a 2 e + a 3 e + a 4 e + a

push

The example below is identical to the one above, except it *doesn't* play on beat three. This is called a *push*. This is often done where a chord is expected to begin on a particular beat (like beat three) and it is played early. Pushes make the music more interesting and contradicts the “tyranny of the bar line”, which can make music too march-like. There is an art to coordinating pushes. See [Comping Strategies](#).

The stroke on the last division *could* be a downstroke, since there are so many un-played pulses. If you replace a downstroke with an upstroke for that reason, you should test your rhythm by selecting from a continuous down-up motion, to make sure you are playing the rhythm correctly.

push beat three

strum/pick	↓				↓				↑							
selection	1				2				a							
full groups of four	1	e	+	a	2	e	+	a	3	e	+	a	4	e	+	a
chord changes	C7								F7							

Note that the “F7” chord is played “early” on the “a” after “4”. Modern composition has established this push (F7 on the “a” after “4”) associates the chord with the second bar.

You can also read about pickups and pushes in [Rhythmic Words and Comping/Varying Rhythm](#).

multiple note pickups and pushes

Pickups commonly involve two or more notes of each value at the end of the previous beat. Here are examples of two-note and three-note pickups and pushes:

original: strumming on beats and and three

strum/pick	↓								↓							
selection	1								1							
sixteenth counting	1	e	+	a	2	e	+	a	3	e	+	a	4	e	+	a
chords	C7								F7

irregular pickups and pushes

Pushes and pickups can also be irregular rhythms, not consecutive pulses. The example of a pickup below occurs on the fifth beat and is the “124” rhythmic word, nicknamed “Creedence”.

irregular three-note pickup to beat one

[illegible]

Rhythmic Displacement

Rhythmic displacement retains the relative spacing between notes in a rhythmic theme, but moves in forward or backward in time.

HOOKS

Hooks are catchy fixed themes repeated, usually without variation, at regular intervals of time, in strategic locations (like the beginning of the song or between sections) or in a pattern in time so the listener expects them, even though they may be dissonant against some of the chords.

Listeners come to expect hooks. They have heard many songs where a hook is repeated in a regular or patterned manner in a song and they expect it to repeat. Hooks should be composed so they stand the test of time and the listener doesn't tire of hearing them over and over.

♩ = 127 Freddie Freeloader in the key of each chord, this uses VIm and Vm with a pedal point root

Swing Eighths

Measures 96-104: Freddie Freeloader. Chords: B \flat 6, B \flat 9, B \flat 6, B \flat 9, E \flat 6, E \flat 9, B \flat 6, B \flat 9, E7, F7. The piece is in the key of each chord, using VIm and Vm with a pedal point root.

♩ = 120 Gloria

Straight Eighths

Measures 112-117: Gloria. Chords: E, D, A, D, E, D, A, D, E, D, A, E, D, A. The piece is in the key of each chord, using VIm and Vm with a pedal point root.

♩ = 127 Here Comes the Sun

Measures 117-123: Here Comes the Sun. Chords: A, F, C, G, D, A. The piece is in the key of each chord, using VIm and Vm with a pedal point root.

♩ = 112 Highway to Hell

Measures 124-129: Highway to Hell. Chords: A, D/F#, G, D/F#, G, D/F#, G, D/F#, A. The piece is in the key of each chord, using VIm and Vm with a pedal point root.

♩ = 115 Honky Tonk Women

This musical score for 'Honky Tonk Women' is in 3/4 time with a tempo of 115 beats per minute. It features a melody in the right hand and a bass line in the left hand. The key signature has one sharp (F#). The score is divided into four systems, each with a treble and bass staff. Chords are indicated above the melody. The first system (measures 130-136) includes chords G, C, F/C, and C. The second system (measures 137-142) includes G, A, D/A, A, D, G/D, D, and G. The third system (measures 143-148) includes G, C, F/C, C, and G. The fourth system (measures 149-154) includes G, D, G/D, D, G, C/G, G, G, C/G, G, and C/G. The bass line consists of a steady eighth-note pattern in the right hand and a simple bass line in the left hand.

♩ = 127 Hurts So Good

This musical score for 'Hurts So Good' is in 3/4 time with a tempo of 127 beats per minute. It features a melody in the right hand and a bass line in the left hand. The key signature has two sharps (F# and C#). The score is divided into two systems, each with a treble and bass staff. Chords are indicated above the melody. The first system (measures 147-152) includes A, Bm/A, A, A6, A, A, Bm/A, A, A6, A, A, Bm/A, A, A6, and A. The second system (measures 153-158) includes A, Bm/A, A, A6, A, A, Bm/A, A, A6, A, A, Bm/A, A, A6, and A. The bass line consists of a steady eighth-note pattern in the right hand and a simple bass line in the left hand.

♩ = 135 I Can See For Miles

This musical score for 'I Can See For Miles' is in 3/4 time with a tempo of 135 beats per minute. It features a melody in the right hand and a bass line in the left hand. The key signature has three sharps (F#, C#, and G#). The score is divided into two systems, each with a treble and bass staff. Chords are indicated above the melody. The first system (measures 154-159) includes E, G, A, E, E, and G6/E. The second system (measures 160-165) includes G6/E, A/E, C/E, D(add9)/E, and E. The bass line consists of a steady eighth-note pattern in the right hand and a simple bass line in the left hand. A 'play 3 times' instruction is present above the second system.

♩ = 135 I Can't Explain

This musical score for 'I Can't Explain' is in 3/4 time with a tempo of 135 beats per minute. It features a melody in the right hand and a bass line in the left hand. The key signature has three sharps (F#, C#, and G#). The score is divided into two systems, each with a treble and bass staff. Chords are indicated above the melody. The first system (measures 166-171) includes E, D, A, and E. The second system (measures 172-177) includes E, D, A, and E. The bass line consists of a steady eighth-note pattern in the right hand and a simple bass line in the left hand.

♩ = 120 **I Fought the Law**

This musical score is for the song 'I Fought the Law' in G major, 4/4 time, with a tempo of 120 beats per minute. It consists of four systems of music. The first system (measures 168-172) features a melody in the treble clef and a bass line in the bass clef, with chords G, C, D, G, D, C, D, G. The second system (measures 173-176) continues the melody and bass line, with chords C, G, C, G, C, G, D, C. The third system (measures 177-180) continues the melody and bass line, with chords C, G, C, G, C, G, D, C. The fourth system (measures 181-184) concludes the piece with chords G, D, C, D, G.

♩ = 120 **Island in the Sun**

This musical score is for the song 'Island in the Sun' in G major, 4/4 time, with a tempo of 120 beats per minute. It consists of one system of music (measures 183-186). The melody is in the treble clef, and the bass line is in the bass clef. The chords are G, Am, D, G.

♩ = 110 **Jack and Diane**

This musical score is for the song 'Jack and Diane' in G major, 4/4 time, with a tempo of 110 beats per minute. It consists of two systems of music. The first system (measures 186-190) features a melody in the treble clef and a bass line in the bass clef, with chords A, E/A, A, E/A, D/F#. The second system (measures 191-194) continues the melody and bass line, with chords A, E, D, E, A, E, D, E, A.

Beatles hooks

Yesterday - the melody and chord progression are so strong, it doesn't need a hook. You could call "I believe in Yesterday" a hook.

Here Comes the Sun (early 1969)- catchy melody & variation. Hook at the end of the verse. "Classical Gas" (1968) style interlude at 1:30.

Come Together- bass theme at the beginning.

Twist and Shout - updated rhythm guitar hook at the beginning is more driving than the Isley Brothers update of the original surf style song by the Top Notes. Probably influenced by 1957 La Bamba.

Hey Jude (Aug '68) - stylized piano comping with chord on the beat. Striking change of mode with anthem-like Mixolydian chorus at the end.

Let It Be (Piggies sessions Sep '68) - stylized piano comping with chord on the beat copied from Hey Jude (Aug '68) and later used on Imagine (1971). Interlude at 1:44 elaborates on the the short phrase at the end of the verse.

In My Life - hook at the beginning.

Blackbird - stylized manner of scalar passages harmonized in tenths with offbeat single notes or pairs of sixteenth strums.

Something - hook at the beginning with remote modulation.

Day Tripper - guitar theme (inspired by Oh, Pretty Woman?)

Stones hooks

Paint It Black

Start Me Up

Can't You Hear Me Knocking

The Secondary Dominant Chord Cycle

See [Secondary Dominant/Scale-Tone Secondary Dominants](#). Apply a melodic curve implied by the graphics below to each chord in the secondary dominant chord cycle. The repeating pattern for the cycle is:

- up a scale-tone third to a dominant seventh (or altered dominant seventh with option sharp or flat five, optional sharp or flat nine).
- up a perfect fourth to a scale-tone triad (or altered scale-tone chord, usually preferring to retain the triad part of the quality).

One exception, the seventh letter of the scale will be represented with bVII major, after which the steps are continued. bVII would go up a third to II7.

In the key of C, the secondary dominant cycle would be: C-E7-Am-C7-F-A7-Dm-F7-Bb-D7-G-B7-Em-G7, then repeat. For examples of the Secondary Dominant Cycle you can play, see [The Original 1-3-5-8-7-3-5-8 Example](#), [Comping Design/Secondary Dominant Patterned Arpeggio Exercises](#) and [Open Position Basslines/Roots and Fifths in Basslines/The Secondary Dominant Progression, Roots and Fifths in the Bass](#).

Represent seventh chords with their triad basis (1-3,-5) and substitute the b7 for a root only if the root can still be represented at least once. Learn to alter major scale-tone chords to make dominant sevenths on every step of a major scale and be aware of the changes that makes in the major scale.

Conforming Modes To the Relative Major and Minor System

To practice establishing temporary or permanent keys on each step of the major scale, each of the chords that follow a seventh chord in the Secondary Dominant Chord Cycle is standardized to a relative major or relative minor scale (major or Aeolian). This means melodies for major chords will use a major scale on their root and minor chords will use Aeolian mode (also called natural minor). Aeolian mode places a tone center on the sixth step of a major scale, so D Aeolian has the same notes as the F major scale and B Aeolian has the same notes as the D major scale. We usually make an exception with scale tone five and leave it in Mixolydian mode, since that mode has been well-established in blues, jazz and rock. So a Secondary Dominant Cycle for C major, would use the C major scale for a G major chord, but the scale would use the mode name “G Mixolydian”.

For scale tone seven, use a major chord on flat seven. Use a major scale on the root of the chord on flat seven. In [Secondary Dominant Cycle](#) for C major, the seventh step would be a Bb major chord with a Bb major scale.

<u>Blues by Five</u>	Bb	harmonic	listen for the single note melody on the piano in the head without the added harmonies four bar theme transposes to IV during the IV chord (bars 5-6), then back to I in bar 7
<u>Mr. P.C.</u>	C	harmonic	four bar theme transposes to IV during the IV chord (bars 5-6), then back to I in bar 7
<u>It Don't Mean a Thing</u>	F#m	harmonic rhythmic	bars 1-4 use a theme with descending minor bassline bars 5-8 use a repeated three-beat theme in 4/4
<u>Naptown Blues</u>	F	fixed	theme emphasizes b7 during IV, which is dissonant but acceptable because of the strong repetition

The Original 1-3-5-8-7-8-5-8- Example

applied to the secondary dominant thirds and fourths chord cycle discussed above. [Click to play.](#)

The musical score is divided into six systems, each containing a treble clef staff with a melody line and a bass staff with fingerings. The chords and their corresponding fingerings are as follows:

- System 1:** Chords C, E⁷_{b9}, Am. Fingerings: C (1 4 2 2 1 2 2 2), E⁷_{b9} (1 4 2 2 1 2 2 2), Am (1 4 3 1 4 1 3 1), C (1 4 3 1 4 1 3 1), E⁷_{b9} (1 4 4 2 1 2 4 2), Am (1 4 4 2 1 2 4 2).
- System 2:** Chords C⁷, F, A⁷_{b9}. Fingerings: C⁷ (1 4 3 3 1 2 2 2), F (1 4 3 3 1 2 2 2), A⁷_{b9} (1 1 4 2 1 2 4 2), C⁷ (1 1 4 2 1 2 4 2), A⁷_{b9} (1 4 4 3 1 3 4 3), F (1 4 4 3 1 3 4 3).
- System 3:** Chords Dm, F⁷, B^b. Fingerings: Dm (2 1 4 4 2 4 4 4), F⁷ (2 1 4 4 2 4 4 4), B^b (1 1 4 2 1 2 4 2), Dm (1 1 4 2 1 2 4 2), F⁷ (2 1 1 4 2 4 1 4), B^b (2 1 1 4 2 4 1 4).
- System 4:** Chords D⁷, G, B⁷_{b9}. Fingerings: D⁷ (2 1 4 4 2 4 4 4), G (2 1 4 4 2 4 4 4), B⁷_{b9} (2 2 1 4 2 4 1 4), D⁷ (2 2 1 4 2 4 1 4), B⁷_{b9} (1 3 1 4 2 4 1 4), G (1 3 1 4 2 4 1 4).
- System 5:** Chords Em, G⁷. Fingerings: Em (1 4 2 1 4 1 2 1), G⁷ (1 4 2 1 4 1 2 1), Em (2 2 1 4 2 4 1 4), G⁷ (2 2 1 4 2 4 1 4).
- System 6:** Chords C, E⁷, Am, G⁷, C. Fingerings: C (1 4 2 2 1 2 2 2), E⁷ (1 4 3 1 4 1 3 1), Am (1 4 4 2 1 2 4 2), G⁷ (2 2 1 4 2 4 1 4), C (1).

These exercises are to be played within a range of nine or ten scale tones of a heptatonic scale, such as the major scale. A nine-note scale can be played within the range of a scale fingered on three consecutive strings. Some heptatonic scale-tone triads will need to have a tenth note added to the scale in order to play a four-note version of the triad (which doubles one of the notes an octave apart).

A melodic curve should be applied to each chord in a chord progression, retaining the same range of notes. This will cause some chords to have their root as the lowest tone (root position), some chords the third (first inversion), and some chords the fifth as the lowest tone (second inversion).

The chords will be primarily treated as triads, but seventh and ninth chords can be implied by occasionally substituting the seventh for the root and incorporating a ninth in place of a scale tone (where possible).

Learn to construct each chord in both the formula and scale-tone methods. In the formula method, the root of the chord is scale tone “1” of a major scale and the remaining notes of the chord are expressed with numbers in relation to that major scale. Common chord formulas are “1-3-5” for major, “1-b3-5” for minor and “1-b3-b5” for diminished.

In the scale-tone method of triad chord construction, a chord is built on each step of the major scale from the number cycle 1-3-5-7-2-4-6-1-3-5, etc. Scale-tone triads for C major are: C (1-3-5), Dm (2-4-6), Em (3-5-7), F (4-6-1), G (5-7-2) Am (6-1-3) and B diminished (7-2-4).

Lowest Scale Tone "1"

♩ = 100

The musical score is written for guitar, featuring a treble clef and a key signature of one flat (Bb). The tempo is marked as ♩ = 100. The score is divided into six systems, each containing a melodic line and a guitar-specific line with fret numbers and fingerings. The melodic line includes triplets and slurs. The guitar line includes fret numbers and fingerings. The systems are labeled with chords: C, E7b9, Am, C7, F, A7b9, Dm, F7, Bb, D7b9, G, and B7b9. The score is numbered 1 through 22.

THEME AND VARIATION SONGLIST

Categories

rhythmic

Themes that fit to the chords by phrasing them to align notes with chord tones...or sub-phrases are played repeatedly with different relationships to the beat each time.

harmonic

Themes that are modified to fit each chord, changing versions of numbered tones and/or substituting adjacent scale tones to cause matching.

fixed

Fixed themes are repeated without variation at regular intervals of time or in a pattern in time so the listener expects them, even though they may be dissonant against some of the chords.

Songs in Progressive Order

<u>title</u>	<u>category</u>	<u>comments</u>
C Jam Blues	C fixed chord	recording flat the two most basic tones, 5 and 1 harmonies added to harmonize with each
My Little Suede Shoes	Eb harmonic	major triad and lower neighbor, mostly 1235 of Eb
In the Mood	Ab harmonic fixed	triads on each chord, I, IV and V tones 5 3 b5, then IVma7 arpeggio
Dizzy Miss Lizzy	A fixed	eight note theme
Bag's Groove	F fixed	all minor pentatonic
Sonnymoon for Two	F fixed	all minor pentatonic
Chitlins Con Carne	C harmonic	fixed on I and IV, second theme for V
S.K.J.	Db fixed	all minor pentatonic

You Know What I Mean	D	harmonic	I Mixolydian theme IV Mixolydian in sixths and licks in IVm7/11 licks in Vm7/11 on V chord

WHAT ARE BEBOP SCALES AND OCTATONIC SCALES?

Bebop Scales

During the development of bebop music, beginning in 1939 with Charlie Parker, Dizzy Gillespie, Charlie Christian, Thelonius Monk and others, manners of improvisation developed which put chord tones on the beat (or with a "push" on the offbeat before a rest or sustain). In playing with continuous eighth notes to establish drive (ongoing movement) with four-note seventh or sixth chords, notes were needed to play on the off beats while moving up and down scales. This was not often done for an entire octave as you might in practicing scales but in smaller ranges of pitch as you would in making melody by ear.

In 1988, David Baker coined the term "bebop scale" in his book *How To Play Bebop* and professed the use of eight-note (octatonic) scales designed to play on four note chords, usually seventh chords and sixth chords of any quality with the chord tones on the beat and non-chord tones on the offbeat. To be authentic, it should be remembered that the in-between notes, the non-chordal tones in bebop scales were originally added in organically, not as part of a practiced "bebop" scale. Barry Harris' method of adding half steps between certain scale tones is closer to the way it's done in bebop and in this chapter.

It is typical that a bebop educator presents four or five examples of bebop scales: major, Mixolydian, Dorian, Aeolian, etc. Why not expand this as many advanced improvisers have done to as many usable versions as possible. Since these might not be recognized by all as "bebop scales", call them "octatonic scales". See below.

Octatonic Scales

All bebop scales are octatonic scales, having eight notes per octave. To play a chord tone on every beat and a non-chordal tone on every offbeat, one note needs to be added to each seven tone scale. The tones are most commonly added are sharp five (flat six) and natural seven. Tones can be added between every whole step in a major scale. Similar to the naming of pentatonic scales, there is a lack of global agreement as to the naming of bebop scales.

An Added Sixth Or Flatted Seventh and One Instance of Added Sharp One

When these scales are played with two notes on each beat, linearly ascending or descending in pitch, the set of four tones that begin each of four consecutive beats produce a chord with a major sixth or with a flatted seventh. The qualities include major sixth (C6, 1-3-5-6), minor sixth (Cm6, 1-b3-5-6), diminished seventh (Cdim7, 1-b3-b5-6), seventh (C7, 1-3-5-b7), minor seventh (Cm7) and minor seventh flat five (Cm7b5, 1-b3-b5-b7). Diminished seventh fingerings are shown in [Prime Scales, Chords and Arpeggios/Arpeggios and Their Scales/Diminished Seventh Arpeggio and Diminished Scale](#).

In one rare case, Mixolydian sharp one, the original scale is mode V of major sharp five. Major sharp five is the parent scale on harmonic minor, where harmonic minor is built on the sixth step of major sharp five. See [Modes/Modes of Four Heptatonic Scales/Major Sharp Five Modes](#).

OCTATONIC SCALE-TONE CHORDS AND PARENT SCALES

The Most Usable Octatonic Scales Ordered by Parent Scale

The scales in the modal groups below are harmonizable except Dorian add natural three, which defies the principal of bebop scales. When ascending from the tonic "D" in D Dorian add natural three, the first, third, fifth and seventh tones don't create a sixth or seventh chord as all the other scales below do.

When the first, third, fifth and seventh tones of an octatonic scale don't create a usable chord on the root, they will create another chord. In that case, the scale can be use as a key scale for the chord it created when the created chord is the current chord in the chord progression.

When a modal group can be harmonized, build a scale ascending or descending in the bass or in the top voice, alternating between inversions of the two chords in the family on consecutive scale tones, like I6 and VIIm7 (or VIIIm7b5 and I6) in the I major add #5/b6 family.

See [Bebop and Octatonic Scale Fingerings](#). There are many octatonic parent scale fingerings which are used for more than one bebop/octatonic scale, making your memorization easier.

Bebop and Octatonic Scale Fingerings by Parent Scale

Scales are shown below in relation to the parent scale. IIm7 is 2-4-6-1 of its parent I major scale, whereas it is 1-b3-5-b7 in the key of the chord as shown by chord scale on the previous "Bebop Scales by Chord Scale" page.

Octave shapes are shown below according to the top named chord. Where there are two or more possible chords, the octave shape shown at the left of each row is oriented to the top chord, which is built in thirds (part of the 1-3-5-7-2-4-6-1-3, etc. series).

Six-Tone Scales

- **Add to Pentatonic or Delete From Heptatonic**
- **Major Pentatonic Add Four**
- **Minor Pentatonic Add Two**
- **Mixolydian No Six**
- **Phrygian Dominant No Flat Six**
- **Minor Pentatonic Add Flat Two**
- **Locrian No Flat Six**
- **Whole Tone Scale**
- **Augmented Scale**

Six-tone scales may also be called *hexatonic scales*.

ADD TO PENTATONIC OR DELETE FROM HEPTATONIC

Numbered in Relation to the Major Scale

Some of these six-tone scales are more easily conceived in terms of a pentatonic scale, others more easily conceived in terms of a seven-tone (heptatonic scale). Regardless, the tones should be numbered after a major scale named after the tone center of the six tone scale.

The C Mixolydian no six six-tone scale has the formula “1-2-3-4-5-b7”, indicating those numbered tones of a C major scale. The “b7” indicates the flattened seventh “Bb” note of C Mixolydian.

A Pentatonic Scale with an Added Note

“Minor pentatonic add two” is usually a better way to conceive “1-2-b3-4-5-b7”. If are more familiar with Dorian and Aeolian mode than with minor pentatonic, you may want to conceive it as Dorian no six or Aeolian no six. The only difference between Dorian and Aeolian is that Dorian has a natural six and Aeolian has a flattened six, so without the “six”, they are the same.

A Heptatonic (Seven-Tone) Scale with a Note Deleted

“1-2-3-4-5-6” can be either “major pentatonic add four” or “major scale no seven”. “1-b2-3-4-5-b7” is best conceived as “Phrygian dominant no six” (or Mixolydian flat two, no six). Phrygian dominant is “1-b2-3-4-5-b6-b7” and Mixolydian flat two is “1-b2-3-4-5-6-b7”.

Use the More Familiar Context or Both

The C major pentatonic add four six-tone scale has the formula “1-2-3-4-5-6”, indicating those numbered tones of a C major scale. It could also be conceived as a C major scale with no seven. If you are more familiar with the major pentatonic fingering used in the fretboard area you are playing “C major pentatonic add four”, think in terms of adding “four” to the C major pentatonic scale. If you are more familiar with the seven-tone C major scale in the fretboard area you are playing, think in terms of “C major scale no seven.” It may be a toss-up and either would work.

Mixolydian, no six could also be conceived as a dominant 7/11 pentatonic with an added two or a ninth arpeggio with all the tones in the same octave (with the ninth as a “two”).

MAJOR PENTATONIC ADD FOUR

“1-2-3-4-5-6” could be called “major pentatonic add four”, “major scale no seven” or “Mixolydian no seven”. It is shown all three ways below with the “1-2-3-4-5-6” scale in the top row, then the other three scales it can be derived from below.

black and gray backgrounds

Triad tones have a black background. The remaining pentatonic tones have a gray background. The added “4” has no colored background.

IMAGINE MELODY AND PLAY IT SPONTANEOUSLY

Conceive melody in a vocal context, so the listener can imagine and predict it with you. Prepare by singing small parts of each scale, arpeggio and melodic design, so you can free associate them, imagine phrases and teach them back to yourself on the guitar. Work to quicken this process, so you can hear melody and play it spontaneously.

Outline Of Procedures

Try imagining a melody, rhythmic theme or chord progression and build on it

Choosing A Fretboard Area That Accommodates the Chord and Scale Tones

Scales: Two, Three or Four Notes Per Beat

Emulating Chords with Arpeggios and Scalar Passing Tones

Triad Arpeggios

Seventh Arpeggios

Ninth, Eleventh and Thirteenth Arpeggios

Chord Tones On the Beat or Pushes

Using Triplets

Using Sixteenth Notes

Making Transitions when the Linear Scale Moves to a Non-Chordal Tone on the Beat

Decoration with Resolved versus Unresolved Melodic Cells

Unresolved cells need to be followed by a target, resolved cells don't.

Scale-tone [Voice Leading](#)

Imagine A Melody, Rhythmic Theme Or Chord Progression First

imagine a melody first and apply a chord progression to it

imagine a rhythmic theme first and apply melodic cells to it

determine a chord progression first and apply a core melody to it

CHOOSING A FRETBOARD AREA

Choose a fretboard area that accommodates the chord and scale tones. For each major or minor chord, there are three regions that are best. See [“Note Sets, Structures and Design”/Triad Arcs](#). For all styles, become familiar with [“Triad Arpeggio Exercises”/Triad Chord and Arpeggio Fingering](#), [“Scale-Tone Arpeggios and Pentatonics”/Open Position Major Scales and Triad Arpeggios](#) and [Major Scale-Tone Triads](#). For jazz and blues, become intimately familiar with [“Prime Scales, Chords and Arpeggios”/Seven-Tone Scales In Seven Areas With Tertian Fingerings In Black And Gray](#) and [ninth arpeggios](#).

Chords

First, play chord fingerings in the position you will be studying. Play chords that will help you memorize many of the available chord tones. Barre chords cover many chord tones, learn a few fingerings for the same chord, if possible to become aware of more available chord tones. See [Fingering Common Chords](#).

Arpeggios

triads

Learn the triad arpeggios in [“Prime Scales, Chords and Arpeggios”/Triad Arpeggios](#). Also, study them in modal context in [Key Scales, Parent Scales and Chord Scales](#)/Parent Scale and Chord Scale Fingerings.

seventh chords

Learn the triad arpeggios in [Prime Scales, Chords and Arpeggios”/Triad Arpeggio](#). Also, study them in modal context in [Key Scales, Parent Scales and Chord Scales](#)/Parent Scale and Chord Scale Fingerings.

ninth, eleventh and thirteenth arpeggios

Learn the triad arpeggios in [Prime Scales, Chords and Arpeggios”/Ninth Arpeggios](#) and [Eleventh and Thirteenth Arpeggios](#).

FUNDAMENTAL MELODIC PRINCIPLES

When you establish a musical architecture, even a somewhat complex one, a listener (even a non-musician) comes to expect its repetition and variation. “Music lives in the imagination” (Aaron Copeland).

Music expresses relationships between scales and chords, so use scale that includes most or all the notes of a chord and draw attention to the chord tones by putting them on the beat. Or play them as the last note before the beat followed by a rest or sustain onto the beat, which is a “push”.

Relate to the Scale

Melody is constructed from a scale that includes all or most of the notes in the chords involved.

Play the C major scale in eighth notes against an accompaniment chord progression made with chords of the C major scale, such as Dm7 G7 Cma7 Am7 (repeating, one bar per chord, ending on Cma7).

Relate to the Chord Tones

To show the relationship to the chord, chord tones are played on emphasized pulses which by are typically placed on the beat. This brings attention to the chord tones and shows a relationship to them. This can also be done with an [appoggiatura](#) (leaning tone), where a non-chordal tone is played on the beat, then immediately resolved to the nearest chord tone by the interval of a scale step.

A pleasing added or changed chord tone. A note played during a chord may not be in the written, spoken or originally conceived version of the chord, but if it is a pleasing addition or change to the chord, it may be added. Functionally, it doesn't matter at first if you know the name of the chord it produces, its enough that it sounds good.

A phrase can also *predict* the sound of the chord immediately after it. For example, in the last two beats of a bar on E7, you may play a phrase that clearly emphasizes tones of the Am chord beginning the next bar.

So, the three exceptional types of notes that can be emphasized during a chord that are not in the chord are:

1. an appoggiatura (leaning tone), where a non-chordal tone is played on the beat then resolved to the nearest chord tone immediately afterward
2. an added (or changed) chord tone
3. notes that anticipate the *next* chord

Use Chord Tone Preferences

The root, third or fifth usually work best to begin a chord. The seventh is usually obscure and weak to begin a chord. If the ninth (or rarely the thirteenth) is prominent in the arrangement it can be used to begin a chord.

Avoid Redundancy

To avoid redundancy, it is preferred that the last note played on one chord is not the same as the first note played on the next chord. This keeps things moving.

Key Scale, Chord Scale and Parent Scale

A *key scale* is the appropriate scale for the current chord group that is named after the key. Most tones in the chord group should be in the key scale.

A *chord scale* is the appropriate scale for the current chord, named after the chord root. All tones of the chord should be in the chord scale.

A *parent scale* is the major scale (or major sharp five, major flat three or major flat six) which is the origin of a key scale or chord scale. A “I” chord would always have the same chord scale and key scale.

The chord scales for groups of chords are commonly modes of the same parent scale.

Using the key scale concept retains your focus on the eventual target chord that the key is named after for both you and the listener. By continually thinking in terms of one major scale, you’ll be able to more effectively retain the sense of key. The examples in this study are therefore shown in relation to the C major parent scale. The key is C major or A minor (“A” is relative minor or “C”). During the VII-III-VI part of the chord progression, the key is VI minor (A minor).

Scales are shown with formula numbers, which are scale-tone numbers in relation to the major scale named after the tone center (in this case, “C”). Arpeggios and chord fingerings are shown with finger numbers on the grid, formula numbers below.

EMULATING CHORDS

Start with Linear Scales

Begin your study with linear scales, ascending up or down the scale. Within the range of the scale that contains an arpeggio as every other note, play two notes per beat (eighth notes) with four beats to the bar. The goal is to play chord tones (1, 3 and 5) on the beat and the non-chordal tones (2 and 4) between the arpeggio tones on the offbeat. Counting the eighth notes with the traditional syllables “1-and-2-and-three-and-four-and” for eighth notes in 4/4/ time, the chord tones would be on the numbered beats and the non-chordal tones on the “ands”.

The Universal Chord Tone-Beat Relationship

In all styles of music, in all cultures, melody relates to the beat by regularly (not always) placing the chord tones on the beat. Most often on the first beat, next most often on the third beat in 4/4 time.

Chords constructed in thirds use every other note of a seven tone scale like the major scale (1-3-5-7-2-4-6 from the root). The chords include triads, seventh, ninth, eleventh and thirteenth chords. A chord is constructed through a range of notes in a scale. The range of notes for a chord constructed with “1”, “3”, and “5” is scale tones “1” through “5”. A skip is playing non-consecutive tones, like 1 to 3 or 2 to 4.

When beginning with a chord tone on the beat and playing the scale without skips in eighth notes through the range of the scale from which the chord was constructed, a chord tone will occur on every beat.

If you have to skip to stay on a chord, make the skip small. The root, third or fifth (sometimes ninth) usually work best to begin a chord. Skip to any chord tone during a chord, but use the odd-number version of it's name.

There are 28 seven-tone harmonizable scales that can be used to place chord tones on the beat with four-note chords like seventh and sixth chords. They are the [Modes of Four Hepatatonic Scales](#) shown in the Modes chapter. Six-note scales like minor add 2-4-b7 minor add 2-4-6, major add 2-4-b7 and major add 2-4-6 can be used with triads.

Every-Other Note of a Major Scale: Full-Tertian Arpeggios

When you play every other note of a major scale (or any other seven-tone scale), it orders the notes in thirds, since note to the next spans inclusively three notes of the scale, such as “one to three” or “two to four”.

“Tertian” refers to a structure of thirds. In Greek, “tertian” means of or concerning thirds. In full-tertian arpeggios, each note is a scale tone third from the next. They are a continuous series of every-other-note, using the numbered cycle 1-3-5-7-2-4-6, repeat. They can provide the master pattern to build major scale-tone arpeggios constructed in thirds (every-other-note).

The fingerings shown at the right are a major scale playing in an order to build arpeggios and chords. Consecutive groups of the black notes can build chords or arpeggios. Consecutive groups of the gray notes can also build chords or arpeggios.

The tertian cycle is F-A-C-E-G-B-D-F-A-C-E-G-B-D letters (shown beginning on F to spell “face”) or 1-3-5-7-2-4-6-1-3-5 in numbers (from “1” to show the four odd numbers “1-3-5-7” followed by the four even numbers “2-4-6”). It is every other note of a major scale. One tertian cycle for C major is C-E-G-B-D-F-A-C (1-3-5-7-2-4-6-1), as shown ascending in gray at the right. Another tertian cycle for C major is BDFACEGBD.

For other keys, apply the key signature. F major is F-A-C-E-G-B \flat -D-F-A-C-E-G-B \flat -D. G major is F \sharp -A-C-E-G-B-D-F \sharp -A-C-E-G-B-D. See [Scale-Tone Arpeggios & Pentatonics/Major Scale-Tone Full-Tertian Arpeggios](#).

letters in C	CEG	DFA	EGB	FAC	GBD	ACE	BDF

In the VII position area, speak the letter name and chord quality (C), followed by singing the name and pitch as you play each note in each of the seven triads built on the unaltered major scale.

Linear Seven-Note Scales in Eighth Notes

Triads, seventh and ninth chords can be constructed from every other note of a scale (1-3-5-7-9 from the root). A chord is constructed through a range of notes in a scale. The range of notes for a chord constructed with “1”, “3”, and “5” is scale tones “1” through “5”. When beginning with a chord tone on the beat and playing *the scale in eighth notes through the range of the scale from which the chord was constructed*, a chord tone will occur on every beat. Remember, you may change direction at any time.

Use chord changes with two bars of 4/4 time for each chord. Eighth notes each chord from the root up to the highest odd-numbered chord tone and back. Start on the root and ascend or start on the ninth and descend. Stay within the range of the arpeggio. You are likely to have intervals over a scale step at the chord change.

linear ascent on the scale

Linear ascent on the scale means playing the notes in forward numerical or alphabetic order without skipping, such as “C-D-E-F-G-A-B-C” or “1-2-3-4-5-6-7-1”.

linear descent on the scale

Linear descent on the scale means playing the notes in reverse numerical or alphabetic order without skipping, such as “C-B-A-G-F-E-D-C” or “1-7-6-5-4-3-2-1”. The non-chordal tones during your linear ascent or descent on the scale are passing tones.

During a chord constructed with tones “1, 3, and 5” of a scale, “2” would be a passing tone between “1” and “3”. “4” would be a passing tone between “3” and “5”. “6” and “7” would be passing tones ascending from “5” to “1”.

play linearly up and down the scale from step one through five without skips

The order 1-2-3-4-5 is linear. So is 5-4-3-2-1. Each note should be one scale tone higher or lower than the previous. "Skips" are non-consecutive intervals like one to three or two to four. Don't use skips in this exercise. You can change direction at any time, but without skipping. So this is legal: 1-2-3-4-5-4-3-2-1-2-3-2-3-4-3-4-5-4-3-4-3-2-1-2-1-2-3. This is not legal: 1-2-3-5-4-3-1-2-3-4-2, because of the movements from 3 to 5, 3 to 1 and 4 to 2.

expand to include the neighbor tones six above five and seven below one

These neighbors can be added without violating the linear "no skip" rule: 1-7-1-2-3-4-5-6-5-4-3-2-1-7-1-2-3-4-3-4-3-2-1-7-1-2-3-2-3-4-5-4-5-6-5.

ascending from five to one

In using linear seven-tone scales on triads, you can transition to the next octave with a version of a sixth or a version of a seventh as the only tone ascending from five to one or descending from one to five.

Using the linear, no-skip rule, play on C major triad with C major scale in the range from one to five. Ascend to the high octave "1" by playing "6", "7" or "b7" between five and 1. This is an "octave transition" for triads, a way to move into the next higher octave.

On minor chords in modes with a flat seventh, ascend from scale tone five to one omitting the sixth and playing only the flat seventh in moving between the fifth and root. On major chords in modes with a flat seventh, omit the sixth or seventh in moving between the fifth and root. On major chords in modes with a major seventh, usually omit the seventh in moving between the fifth and root.

descending from "one" down to "five"

Using the linear, no-skip rule, play on C major triad with C major scale in the range from one to five. Descend to the five below one by playing "6", "7" or "b7" downwardly between one and five. This is an "octave transition" for triads, a way to move into the next lower octave.

Change of Direction

Play eighth notes on each chord, beginning with a chord tone on the beat. Use stepwise motion only, no skips (except the lower neighbor sixth, as mentioned in the previous step). Start on any chord tone and ascend or descend within the range of the arpeggio.

You may change direction at any time, but stay within the range of the arpeggio. When changing direction on a non-chordal tone, the non-chordal tone becomes a *neighboring tone*. Remember, the non-chordal tones during your linear ascent or descent are *passing tones*.

Inserting Consecutive Arpeggio Tones

Passages of arpeggios constructed in thirds may replace stepwise passages. Three consecutive arpeggio tones (or any odd number of them) followed by stepwise scalar movement will also keep arpeggio tones on the beat. Consecutive arpeggio tones cause chord tones on the offbeat, in addition to on the beat. When you play a chord tone on the offbeat, be sure to play another chord tone on the following beat.

Skips are allowed within the arpeggio, which can be used to approach another octave of the same chord. Once you are in the next octave higher or lower, be sure to play the last consecutive chord tone on the beat, then move to a neighboring scale tone on the offbeat.

D/E

The musical score consists of a melody line in treble clef with a key signature of two sharps (F# and C#). The melody starts at measure 14, marked with a repeat sign. It features a series of eighth and quarter notes, with measure numbers 14, 15, 16, and 17 indicated above the staff. The melody concludes with a double bar line and repeat dots. Below the melody is a fretboard diagram with three staves labeled T (Treble), A (Alto), and B (Bass). The diagram shows the fret numbers for each string across measures 14, 15, 16, and 17. Measure 15 includes a text annotation: "substitute 5-b7-1 for 5-6-b7". Measure 16 includes a text annotation: "substitute 1-b7-5 for b7-6-5".

CHANGING CHORDS

Target Tones And Setup Tones

A *setup tone* is the last note played before a *target tone* (chord tone). It usually progresses to the target tone up or down a scale step. The setup tone creates a stronger feeling of movement if it is not in the current chord. The scale can be a seven tone scale or pentatonic scale, as long as the interval from the setup tone to the target tone is a minor third or less. A *setup tone* can also be the fifth of the target tone chord (usually approaching from below).

An *upper neighboring tone* is a scale tone immediately above a chord tone in pitch. A *lower neighboring tone* is a scale tone immediately below a chord tone in pitch. Upper and lower neighbors must be the interval of a minor third (three frets, inclusive) above or below the target tone, so pentatonic scales can be used for upper and lower neighboring tones *except* not where the interval is over a minor third.

So, a *target tone* is a chord tone which is preceded by a *setup tone*. A lower neighbor can be the seventh (or b7) of the target tone, the next lower tone in a seven tone scale, or the sixth (as in a 6/9 type pentatonic scale), where the chord quality permits (I, IV, V and IIm chords). An upper neighbor can be the minor third (b3) of the target tone chord.

If the target chord tone is a chord root (has the same letter name as the chord), the fifth of the target tone may be used as a setup tone to approach the target tone from below.

Chromatic setup tones approach a target tone from a half step (one fret) below. They may approach from above target tone *if* they are filling in a whole step between an upper neighbor and the target tone. When a scale tone occurs a half step above a target tone, it doesn't need to be called "chromatic".

Setup tones and target tones are notably used in bass lines. It is typical for bass lines to use chord tones more frequently and setup tones are critical in making the transitions.

Odd-Numbered and Even-Numbered Tones of the Chord Scale

These procedures are primarily applicable to scale-tone chords constructed in thirds, such as seventh and ninth chords. In terms of the chord scale (the scale named after the root of the current chord), these are odd-numbered tones: "1, 3, 5, 7, 9, 11 or 13". You would play eighth notes through the range of the scale from which the chord was constructed, moving from one scale tone to another. You may change direction at any time.

In terms of the current chord scale, many tones of the next chord will be even-numbered. Once you begin playing on the next chord, the tones are re-numbered in terms of its chord scale. When you descend from the root of a chord, the root needs to be numbered "8", instead of "1". When you ascend to the next higher octave of a chord root, it also needs to be numbered "8", instead of "1".

SHARED-NOTE REDUNDANCY

Preserve Energy and Drive by Avoiding Shared-Note Redundancy

Up tempo music like bebop, swing and bluegrass share a preference to keep the notes changing, unless repeating a note consecutively with a thematic rhythm. This sustains the drama of the melodic line, keeps the melody exciting.

shared-note redundancy

As you are improvising and you see that the last note of the current chord (the setup tone) and the first note of the next chord (the target tone) would be the same note, the situation could be called a “shared note redundancy”. Avoiding the shared-note redundancy will preserve energy and drive.

Devices To Avoid Shared-Note Redundancy

when the setup tone and target tone would be the same note

Remember, when the setup tone and the target tone would be the same note, the situation is called a “shared note redundancy”. This term is used repeatedly below.

change the setup tone to a neighbor of the target

An option for a shared-note redundancy is to choose a neighbor one tone beyond the target, replacing the setup tone with a tone approached by a skip to a neighbor of the target tone. This is usually more effective if the skip is an interval of a sixth or less. The alternate tone can be below or above the target. The alternate tone should not be the same note as the note before it (the second note before the target tone) or *that* would create a redundancy with two of the same note consecutively.

This usually produces a scalar encircling, which occurs when the melody skips to a target tone neighbor that passes the target tone then moves to the target tone, it could be said that you are “encircling” the target tone. You can encircle by ascending to an upper neighboring tone of the target tone, then resolve down to the target tone. You can also encircle by descending to a lower neighboring tone of the target tone, then resolve up to the target tone.

Chords: Em, Am, B, Em

pushed target tones

By playing a chord tone on the offbeat (the “and” of the beat) and following it with a rest or sustain onto the next beat, the note the offbeat functions the same as a chord tone on the beat. This is called a “push” This is acceptable and even preferable in syncopated styles like bebop, swing, up-tempo blues and funk.

A “push” could be used to solve shared-note redundancy by omitting the target tone when would have been the same note as the setup tone. In place of the setup tone, a rest or a sustain of the setup tone onto

the beat would have much the same effect in establishing a chord tone at the beginning of a chord that a target tone would. It is another version of a target tone.

rest push

use a current chord tone in place of the setup tone

When the setup tone and target tone would be the same note, another option is to play another chord tone of the current chord in place of the setup tone, as long as it is not a note of the target tone chord. Since you will then be playing two consecutive chord tones, the chord tones can span an interval up to a sixth and still be followed by the listener.

SIX-TONE SCALES WITH TRIAD TONES ON THE BEAT

Six-note scales are in common use, but not often recognized as such.

Minor pentatonic is often used with an added “2”, making a six-tone scale with tones 1-2-b3-4-5-b7. This scale could be called “minor pentatonic add two” or “minor eleventh scale”, since it has the notes of a minor eleventh chord. Since Aeolian and Dorian mode each contain 1-2-b3-4-5-b7, this scale could also be called “Aeolian no six” or “Dorian no six”.

Major pentatonic is very often used with an added “4”, making the six-tone scale with tones 1-2-3-4-5-6. This scale “major pentatonic add four”, “major no seven” or “Mixolydian no seven”.

A variant of “minor pentatonic add two” is “dominant 7/11 pentatonic add two” with tones 1-2-3-4-5-b7, which could be called “dominant eleventh scale”, since it has the notes of a dominant eleventh chord. It could also be called “Mixolydian no six”.

Anticipate Shared-Note Redundancy and Respond

To sustain the energy in your improvisations on moderate and up-tempo pieces, it is preferred that you don't repeat notes consecutively unless you are using the repeated note to state a rhythmic theme. This situation where the last note of one chord and the first note on the next chord are the same can be called a shared note redundancy. Anticipate situations where the last note on one chord would be the same note as the first note on the next chord and use a melodic device to avoid the redundancy. Read the previous section [Shared Note Redundancy](#).

recognizing shared-note redundancy

During approximately the last four notes before a chord change, visualize the location of the tones of the next chord, most importantly the triad part of the next chord. If you don't have a thorough knowledge of triad arpeggio fingering, acquire it. At first, at least acquire it for the current situation.

Imagine playing the last four notes of the current chord. Perform one of the responses below in moving from the last note of the current chord to the first note in the next chord.

small interval Whether or not the last note of the current chord is in the next chord, move from the last tone of the current chord to the nearest tone in the next chord, preferably by an interval of a minor third or less.

If the last note of the current chord is in the next chord, use one of these options:

- ✦ **create a push** don't play at the beginning of the next chord. Sustain the last note of the current chord (sustain push) through the beginning of the next chord or leave a rest at the beginning of the next chord (rest push).
- ✦ **scalar encircling** Go one note beyond the target, then play the target.

Can't You See chord tone-beat exercise, avoid shared-note redundancy - [click to play](#)

Where the last note on one chord would be the same note beginning the next chord, opt to keep the energy moving with changing notes with scalar encircling or a push. SE = scalar encircling, RP = rest push, SP = sustain push.

♩ = 160

The exercise consists of four systems of guitar notation, each with a treble staff and a bass staff (TAB). The tempo is 160 BPM. The key signature is one sharp (F#).

System 1: Treble staff starts with a whole rest, then measures 1-4. Measure 1: D major pentatonic add four (10 8 7 9 7 9). Measure 2: D major pentatonic add four (7 9 7 9 7 9). Measure 3: C major pentatonic add four (7 10 7 9 10 9) with a sustain push (SP) from the previous measure. Measure 4: C major pentatonic add four (10 7 10 8 10 8 7 10).

System 2: Treble staff measures 5-8. Measure 5: G major pentatonic add four (7 10 7 9 10 7 9) with a rest push (RP). Measure 6: G major pentatonic add four (7 10 9 7 10 7 9). Measure 7: D major pentatonic add four (7 10 9 10 7 9 7 9) with a scalar encircling (SE) from the previous measure. Measure 8: D major pentatonic add four (7 9 7 9 7 10 9 7).

System 3: Treble staff measures 9-12. Measure 9: D major pentatonic add four (10 7 10 7 9 7 9 10). Measure 10: D major pentatonic add four (7 9 7 9 7 9 10). Measure 11: C major pentatonic add four (7 10 7 9 10 9 7) with a rest push (RP) from the previous measure. Measure 12: C major pentatonic add four (9 7 10 7 10 8 7 10).

System 4: Treble staff measures 13-16. Measure 13: G major pentatonic add four (7 10 7 9 7 9 10) with a sustain push (SP) from the previous measure. Measure 14: G major pentatonic add four (9 7 10 7 10 7 10 9). Measure 15: D major pentatonic add four (7 10 7 9 7 9 7 9) with a scalar encircling (SE) from the previous measure. SEVEN-TONE SCALES WITH 7TH, 9TH, 11TH OR 13TH TONES ON THE BEAT

playing scales on seventh chords with chord tones on the beat

- ✦ transition to the next octave by converting even tones to odd
- ✦ transition bebop/octatonic scales to emulate seventh arpeggio

Moving Down from the Root on Seventh or Larger Chords

In playing on seventh or larger arpeggios on a single chord, moving down melodically from the root to the seventh requires a transition similar to that moving to another chord. A setup tone is needed to move down to the seventh. Replace stepwise movement down to the seventh with the interval of a third or a chromatic, (only when the chord tone is a flatted seventh).

Odd-Even Transitions by Rhythm

When a the current chord tones are odd-numbered tones of its chord scale, the target tone for the next chord is often an even-numbered to of the scale of the current chord. When this is the case, a transition needs to be made. Once the transition is made, a new chord scale is considered for the new chord where the even-numbered note is then re-assigned an odd number.

When you approach the root of the current chord in the upper octave, it is virtually treated as a new chord, in that its root is “8”, and is not an odd-numbered tone. Therefore, a transition from odd to even needs to be made.

Change The Rhythm On The Last Beat

Use a single note on the last beat of the current chord.

One of the following sets of three notes:

an eighth and two sixteenths

two sixteenths and an eighth

a sixteenth, an eighth and a sixteenth

a triplet.

Odd-Even Transitions by Fragment Pattern

Beginning on an odd-numbered chord tone, play four sixteenths with a “1-3-4-5” or “1-2-3-5” fragment pattern to transition to even-numbered tones.

Ninth, Eleventh and Thirteenth Arpeggios with Passing Tones

Ascending from the root to the ninth in eighth notes, chord tones 1-3-5-7-9 will occur on the beat. Descending from the ninth to the root in eighth notes, chord tones 9-7-5-3-1 will occur on the beat. Within the range of the chord, you may change direction on an upper neighbor at the top of a chord (1-2-3-4-5-6-7-8-9-10-9), or on a lower neighbor at the bottom of a chord (5-4-3-2-1-7-1), or on any other tone (within the range of the chord).

Ninth Chords with Three Common Tones

Use chord changes with one or more bars of 4/4 time for each chord. Use scale-tone ninth chords. Any part of IIm7b9 VIm9 IIm9 V9 Ima9 IVma9 will work, such as B7b9#9n3 Em9 Am9 D9 Gma9 Cma9 of G major (IIm7b9 = III7b9#9 no third).

At the chord change, make sure you are playing with the range of chord tones common to the current and next chord. In the VIm9 IIm9 V9 Ima9 IVma9 chord progression, the root, third and fifth of each chord become the fifth, seventh and ninth of the next.

No transition will be necessary at the chord change. Venture into the non-contiguous part of each arpeggio (the part not common to both chords) as long as you get back to the contiguous area (common to both chords) at the chord change.

The musical notation shows a sequence of ninth chords in G major: B7b9#9 no third (= Bm7b9), Em9, Am9, D9, Gma9, and Cma9. The notation is presented in two systems. The first system contains the first four chords (B7b9#9 no third, Em9, Am9, D9) and the second system contains the last two (Gma9, Cma9). Each chord is represented by a single staff with a treble clef and a key signature of one sharp (F#). Below each staff is a bass staff showing the fret numbers for the T (Treble), A (Alto), and B (Bass) strings. The fret numbers are: B7b9#9 no third (T: 7, 8, 10, 12, 10, 8, 7, 10; A: 4; B: 4), Em9 (T: 7, 10, 8, 10, 8, 7, 9, 7; A: 10; B: 7), Am9 (T: 9, 7, 9, 7, 10, 9, 10, 7; A: 9; B: 7), D9 (T: 9, 7, 10, 7, 10, 9, 7, 10; A: 9; B: 7), Gma9 (T: 7, 10, 9, 10, 7, 10, 9, 7; A: 10; B: 7), and Cma9 (T: 10, 8, 7, 8, 10, 8, 7, 5; A: 10; B: 7).

Similarly, scale-tone seventh chords have two tones in common with one another when their root progression is in fourths. Scale-tone eleventh chords have four notes in common with root progression in fourths and such thirteenth chords have five in common.

Playing a Scale Linearly Through the Range of an Arpeggio Spanning Over an Octave

Ninth, eleventh and thirteenth arpeggios can be ascended or descended with scalar passing tones between the chord tones through their range which exceeds an octave.

lower neighboring sixth

The lower neighbor may be the seventh of the scale, or a sixth, where the sixth is a major sixth (such as and “A” note as a sixth for a “C” root). Below, the lower neighbors are the sixth of the root which they precede. In the major scale this occurs with the chords constructed on major scale tones one, four, five (on which major chord are constructed) and on scale tone two. In the G major scale example shown below, this would be for the chords Am9, D9, Gma9 and Cma9.

Using Consecutive Upper Chord Tones to Move into the Next Higher Octave

Arpeggio tones greater than an octave (the ninth, eleventh and thirteenth) are stepwise neighbors to the lower arpeggio tones of the same chord in the next higher octave. Conversely, the lower arpeggio tones of a chord are the stepwise neighbors of the tones greater than an octave for the same chord in the next lower octave.

Transitions to these arpeggio tones of the same chord in another octave are similar to transitions to the notes of another chord, in that the tones not in one chord are in the other.

Ascending an arpeggio constructed with odd-numbered tones larger than an octave skips the even-numbered tones eight, ten, etc., which begin the *upper* octave of the same chord. The note an octave (eight) above the lower arpeggio's root is the root of the upper arpeggio. The note a tenth above the lower arpeggio's root is the third of the upper arpeggio. The twelfth above the lower root is the fifth of the upper and the fourteenth of the lower root is the seventh of the upper.

upper neighbor to the highest chord tone

Practice descending the arpeggios as well as ascending. This example descends each arpeggio from the ninth with an upper neighboring tone:

The musical notation shows six descending arpeggios, each starting from the ninth and including an upper neighbor tone. The chords are B7b9, Em9, Am9, D9, Gma9, and Cma9. The notation includes a treble clef, a key signature of one sharp (F#), and a 4/4 time signature. Below each staff, the fingerings for the thumb (T), index (A), and middle (B) fingers are indicated with numbers 1-10.

BEBOP/OCTATONIC SCALES WITH SEVENTH CHORD TONES ON THE BEAT

[Bebop and Other Octatonic Scales](#) are in common use and are known to many jazz musicians. As eight-note scales, every other note can emulate a four-note chord, usually a seventh chord or sixth chord.

CHORD-BEAT WITH SEXTATONIC SCALES, OCTATONIC SCALES AND NINTH ARPEGGIOS

key scales for single note improv

The important part of melody is usually conceived in the vocal context. These scales should usually follow that idea and emphasize the tonic chord after which the key is named. The six-tone scales below are used in bluegrass and celtic music as a main resource in addition to the vocal context. The octatonic scales should be used in part to build phrases, rather than ascending and descending an entire octave.

chord scales for double stops and chord scale

Double stops tend to use a scale named after each chord. Some melody is based on the chord scale when chords have shorter durations (in seconds). Since these chords have long durations, you can play in the key of the chord. In terms of melody conceived in the vocal context, still strive for key scale melody.

IV major pentatonic add four

Four major pentatonic add four is part of IV major scale, rather than Lydian. In modern pop styles that use pentatonic scales, the chord scale for the IV chord is often used as IV major scale.

E Form Parent Scale

SUBSTITUTING PENTATONICS WITH CHROMATICS

Five-note pentatonic figures including a chromatic tone which chromaticize a triad can be substituted for four consecutive scale tones of a major scale (or other appropriate seven tone scale).

With major pentatonic (1-2-3-5-6 of major), the numbered tones 1-2-#2-3-5 (5-3-b3-2-1) can be substituted for 1-2-3-4-5 (major or Mixolydian) or for 1-2-3-#4-5 (Lydian). This puts the “b3” on the beat and darkens the mood slightly. This is used on the D9, Gma9 and Cma9 in the example below.

With minor pentatonic (1-b3-4-5-b7 of major), 1-b3-4-#4-5 can be substituted for 1-2-b3-4-5 (Dorian, Aeolian or harmonic minor) or for 1-b2-b3-4-5 (Phrygian). Use this in ascending form only for now. We will need to use a special chromatic treatment later in descending. This is used on Em9 and Am9 in the example below.

With dominant 7/11 pentatonic (1-3-4-5-b7 of major), 1-3-4-#4-5 can be usually be substituted for 1-2-3-4-5 of Mixolydian D9 as shown in the example below. 1-3-4-#4-5 can usually also substitute for 1-b2-3-4-5 of Phrygian major, as used on the B7b9 chord in the example below.

NEEDS EXAMPLE

The fifth, seventh and ninth of the VIm7, IIm7 and V7 chords each constitute a minor triad. Each of those triads can be chromaticized, as with the examples above.

USING TRIPLETS

Scalar eighth note triplets would include a chord tone on the first of every two beats. They should typically be started on the first and/or third beats, since those are metrically stronger accents. Triplets can be made to align chord tones on the beat by filling in thirds chromatically or by using two setup tones. Major thirds have four half steps, a triplet bridging a major third must involve one whole step.

In ascending and descending a minor ninth chord with triplets and inserted chromatics, use a chromatic scale from the root to ninth except omit the major third and major seventh. With a Mixolydian ninth chord, omit the major second and minor seventh. With a Phrygian major ninth chord (7b9) omit the major second. With a major ninth chord, omit the minor second and omit the minor sixth or minor seventh.

USING SIXTEENTH NOTES

Most of the principles outlined for scalar eighths may be used in “double time” with scalar sixteenths.

Beat units of scalar sixteenths may be combined with scalar eighths.

CHROMATICIZED ARPEGGIOS

The [Chromaticized Arpeggios](#) chapter shows how to emphasize chord tones on the beat while adding chromatics to arpeggios.

VOICE LEADING CADENCES WITH EMULATED CHORD TONES

(preceding a chord root from it's fifth is also included)

Root progression refers to the change from the letter name of one chord to the letter name of the next chord. Each chord tone listed in the at the top of the columns in the diagrams below (root, third, fifth, seventh and ninth) will have specified possible movements shown below it. See [Voice Leading](#).

Scale-Tone Ninth Chords with Root Progression up A Fourth (equals down a fifth)

chord root progresses up a fourth

The root and third of the arpeggio representing the current chord will each move to the root of the arpeggio representing the next chord (root up a fourth and third up a scale tone). The fifth, seventh and ninth of the current chord arpeggio can each move up or down a scale tone and either way will arrive on an arpeggio tone of the next chord.

chord root progresses down a fifth

The root, third and fifth of the current chord are respectively the same tones as the fifth, seventh and ninth of the chord whose letter name is down a fifth. The seventh and ninth of the current chord are out of range of the arpeggio for the next chord whose root is down a fifth (from the root of the current chord).

root progression	root	third	fifth	seventh	ninth
up a fourth	up a fourth	up a scale tone	up or down a scale tone		
down a fifth	common tone			out of range	out of range

Scale-Tone Ninth Chords With Root Progression Down A Fourth (equals up a Fifth)

chord root progresses up a fifth

The root and third of the arpeggio representing the current chord are out of range of the arpeggio for the next chord whose root is up a fifth (from the root of the current chord). The fifth, seventh and ninth of the current chord are respectively the same tones as the root, third and fifth of the chord whose letter name is up a fifth.

chord root progresses down a fourth

The root, third and fifth of the current chord arpeggio can each move up or down a scale tone and either way will arrive on an arpeggio tone of the next chord. The seventh of the current chord becomes the third of the next chord. The ninth of the current chord can move down a fifth to the root of the next chord.

root progression	root	third	fifth	seventh	ninth
up a fifth	out of range	out of range	common tone		
down a fourth	up or down a scale tone			common tone	down a fifth

Other Voice Leading

In making a transition to the next chord root down a third, the movement can be from the root of the original chord down a fourth, then up a step to the new root.

MELODIC CELLS DEFINED

Cells are the smallest units of melodic design. They are made with structures like scales, arpeggios, intervals and chromatics. Cells usually are used with various expressive design elements involving technique, phrasing, rhythm, dynamics, etc. Melody is the designed repetition of cells.

Cells of Creative Origin

Cells may be created organically with the right brain, by recalling and modifying known melodic ideas. In improvisational music, these cells are called *licks*. In classical music, cells are created compositionally and are called *motifs*.

Cells of Logical / Mathematical Origin

A composer may imagine an idea, then process it logically to conceive variations. An improviser can expand their capabilities by studying variations on a cell and integrating those variations into their improvisational style.

Cells may be varied as to their chord type, scale type, rhythmic word, rhythmic displacement. They usually may be played in reverse order.

CELLS ON SETUP CHORDS OR TARGET CHORDS

Target Chords

A tonic chord is the chord after which a key is named and is the chord you would expect the song to end on. Many chords in a progression can be treated as temporary tonic chords to enjoy the melodic and harmonic designs that support them. It is common that I, II, IV, V and VI chords are treated in as temporary tone centers.

The actual tonic chord and any temporary tonic chords can be treated as *target chords*, as if they were tonic chords. This is done by anticipating them with scales or chords.

Preview the Target Chord

Probably the simplest way to anticipate a target chord is to play its arpeggio or a scale containing its arpeggio *before* the target chord, during another chord. This should be usually be done for about one second, at most (see The One Second Rule, below).

Cadences

anticipate with cadences

Chords can anticipate a target chord by use of well-known short chord progressions called *cadences* that, in the repertoire in which we have known them, have established the key. Over and over, in most styles of music, we have heard a chord built on the fifth step of the tonic scale (scale named after the key) anticipating the tonic chord, such as G7 (V7) to C (I) in the key of C. In classical and jazz, then pop music, we have heard chords in sequences of fourths (7, 3, 6, 2, 5, 1, 4) that lead to the I chord, especially IIm, V, I (Dm, G, C in the key of C) or IIm7b5, V, Im (Dm7b5, G, Cm in the key of C minor).

A common jazz variation that became popular with bop music is the [flat five substitute](#), where an altered V chord (such as G7b5b9) is substituted with a synonym chord (Db7b5#11) whose root is a flatted fifth up or down. Since a flatted fifth interval is a half an octave, it produces the same note up or down.

represent cadences with arpeggio

Cadences can be represented with arpeggios and those arpeggios can be decorated with scales.

The One to Two Seconds Rule

It is common that melodies emulate a chord immediately before a target chord that have little or nothing to do with the chord in the accompaniment at the time.

For example, you may be playing in bar two of a jazz blues in C where the current chord is F7, but you are playing G7b9 at the end of the bar to anticipate the C7 chord that begins bar three with a cadence. The notes of the G7b9 are largely different from those of the F7 in the accompaniment and would sound pretty bad if you did not hear them resolve to the C7 chord. If the listener only hears this discrepancy for about one to two seconds (two to four beats at 120 beats per minute), they won't have time to contemplate the discrepancy and will hear the resolution to C7 soon enough. If, on the other hand, you played the G7b9 sound for over two seconds, the listener may have time to recognize that it does not harmonize with the F7 chord actually being played in the accompaniment.

This phenomenon is not restricted to jazz. It occurs in every popular style of improvisational music (rock, blues, jazz, folk, reggae, funk, punk, etc.).

INTEGRATING CELLS INTO YOUR IMPROV

Get four-note cells into your memory, in a melodic context. Not only memorize the cell, but create ideas that use them and incorporate those ideas into your improv. Sing your lines as you play them.

Practice Each Separate Cell

If possible, practice a series of related cells (each changing only a note or two, or the same structure played on a different chord tone or different fingerings). Learn to phrase each cell against the chords, starting in the appropriate part of the bar.

Free Improv at the Same Rhythmic Level as the Cell

Establish familiar, easy improv with continuous rhythm (i.e. continuous eighth notes) without these new cells at the same rhythmic level as the cell.

Whimsically Combine Cells and Free Improv

Combine the cells with free improv by improvising right up to the cell, playing the cell on the intended part of the bar, and coming out of the cell back into continuous free improv. Progress from playing on a simple chord progression or even a single chord to more complex progression.

whimsical games

Globalize any element (see [Globalizing](#)). Practice a set of instances of an element (like a melodic cell). Improvise on something conducive to using an instance of the element and whimsically incorporate one instance on call, then two, then more. For example, play up and down the tones of a ninth arpeggio. As you approach any one of the numbered tones (1-3-5-b7-9), think that number and play the melodic cell that decorates it, such as two chromatic tones below it. Practice this until it is easy for you to think and apply the melody cell to any chord tone.

Personalize Your Cells

Evolve the use cell with your personalized treatment such as slurring, decorating, phrasing and incorporate it into your improvisational style so you'll review it when you improvise. In improvising, you recall previously learned ideas and modify them to fit what you are playing on. We are working at adding cells to your mental library, and will work on the modifications necessary to adapt a cell to what you are playing on.

Personalize each cell by deciding on variations of it with changes of slurs, dynamics, rhythm, scale and chord quality to be applied to genres and songs in your repertoire.

CHROMATICIZED ARPEGGIO CELLS

Generally, chromaticizing arpeggios involves one or more of these three actions: fill in between chord tones with half steps, fill in chromatically between a neighboring scale tone and a chord tone or precede a chord tone from a lower chromatic tone a half step below.

It is preferable to get chord tones on the beat or to push the beat by playing a chord tone before a beat then sustaining onto the beat or putting a rest on the beat

LINEAR SCALES AND ARPEGGIOS AS CELLS

Key Scale or Chord Scale

with emphasis of current chord tones (duality tones)

The most basic melodic cell is a linear ascent or descent on a scale. Joy To The World descends a major scale one octave from the tone center. The guitar theme in My Girl ascends a major pentatonic for one octave. The first theme in George Benson's version of Breezin' starts by ascending a major scale from five to five.

Syncopated rhythm is very useful in bringing a scalar passage to life.

Arpeggios of the Current Chord

Melodies sometimes arpeggiate chords. Bach's Well-Tempered Clavier, Prelude 1 in C is all arpeggios. The instrumental opening and recurring theme in Mr. Sandman is quadrad (four-note) arpeggios. In The Mood is triad arpeggios. The first guitar solo to Comfortably Numb has passages of major arpeggios. The Sultans of Swing solos have frequent triad arpeggios. The two-guitar ending in Hotel California has two guitars, each playing arpeggios in harmony with one another.

Bach's Well-Tempered Clavier, Prelude 1 in C

Mr. Sandman

Comfortably Numb

Like with scalar passages, arpeggio passages are much more interesting with syncopated rhythm.

Afternoon In Paris - linear arpeggios

Arpeggio Phrases with Non-Chordal Tones

Two and Three String Cluster Playing

two strings tuned in fourths

three strings tuned in fourths for fragment patterns

three strings tuned in fourths for theme and variation

numbered fingering for two or three strings in fourths

My major scale in-position numbering system uses the major scale-tone number of the lowest-pitched note on the sixth string to number the fingering. If you were to fret a G major scale in the second position, the lowest reachable tone is "F#", scale tone seven. So that would be fingering 7. Here are the seven fingerings in that system:

seven in-position fingerings, numbered by scale tones

Major scale fingerings are numbered in this course according to the number of lowest note fingered with the index finger on the sixth string. The seven in-position fingerings are shown below. Scale tones are numbered. The scale-tone numbers shown in parenthesis are options, where the same note can be fingered on the an alternate string.

fingering 1 3 index reaches	fingering 2 2 pinky reaches	fingering 3 no reaches	fingering 4 2 index reaches	fingering 5 4 index reaches	fingering 6 1 pinky reach	fingering 7 no reaches

in-position major scale fingerings by finger number

"1" is the index finger, "2" is the middle finger, "3" is the ring finger and "4" is the little finger.

fingering 1 3 index reaches	fingering 2 2 pinky reaches	fingering 3 no reaches	fingering 4 2 index reaches	fingering 5 4 index reaches	fingering 6 1 pinky reach	fingering 7 no reaches

Flipping Tertian Cadences

(using other [full tertian](#) containing non-chordal tones to full tertian containing the current chord)

Flipping tertian melodic cells are an important part of the improvising puzzle. They are very effective in connecting other melodic cells across chord progression.

Imagine you are on the root of a chord and you want to improvise around the seventh and ninth adjacent to the root, as part of a ninth arpeggio. In relation to the seventh and ninth, the root is an “8” (octave). You’ll need to move up or down a scale tone to get on the tertian cycle. So, this is a matter of moving from an even-numbered tone (2, 4, 6, 8, 10 or 12) to an odd-numbered tone (1, 3, 5, 7, 9, 11 or 13).

Large tertian chords are built with odd-numbered tones: 1, 3, 5, 7, 9, 11 or 13. If you are currently on an even-numbered tone (2, 4, 6, 8, 10 or 12), you can use one of the four-note cell types below to transition.

In addition to using these as a solution to an inadvertent problem, you can also “create a drama” by intentionally using an even-numbered chord tone like a sixth on the beat, then resolve it with a flipping tertian melodic cell.

Learn to play these melodic cells in each of the six major scale fingerings [shown in Prime Scales, Chords and Arpeggios/Major Scale Fingerings/versions suited to play scales](#).

four-note versus three-note cells

We are studying four-note flipping tertian cells in this section. Three-note flipping tertian cells don’t require much study since they easily move to the tone up or down a scale tone. “123” leads to “2” stepwise. “321” leads to “7” stepwise.

1-2-3 resolves to 2

1-2-3-2 transitions up a scale tone, as "C" to "B" below

3-2-1 resolves to 7

3-2-1-7 transitions down a scale tone, as "C" to "B" below

mordent as a flipping tertian

Any of the four notes in these flipping tertian melodic can be an upper or lower mordent for bebop ornamentation. Mordents on chromatic tones (#1-#2-#5-#6) should employ lower chromatic embellishments. The [Autumn Leaves flipping tertian](#) examples use mordents in sixteenth triplets.

1-3-2-1 and 1-6-7-1

1-3-2-1 and 1-6-7-1 begin with a third, then return stepwise to the original note. They can end up or down by a scale-tone interval up to a minor third.

1-3-2-1

1-3-2-1-7 transistions down a scale tone, as "C" to "B" below

1-3-2-1-2 transistions up a scale tone, as "C" to "B" below

1-6-7-1

1-6-7-1-7 transistions down a scale tone, as "C" to "B" below

1-6-7-1-2 transistions up a scale tone, as "C" to "D" below

1231 and 1761

1231, 1761 begin with three scalar tones, then skip by a third to the original note. They can end up or down by a scale-tone interval up to a minor third.

1231

1-2-3-1-7 transistions up a scale tone, as "C" to "D" below

1-2-3-1-2 transistions up a scale tone, as "C" to "D" below

1-7-6-1

1-7-6-1-7 transistions down a scale tone, as "C" to "D" below

1-7-6-1-2 transistions up a scale tone, as "C" to "D" below

12167, 12132, 17167, 17132

These begin like a mordent (a neighbor and a returning note), then a third up or down, then a returning note.

1-2-1-6-7, 1-2-1-3-2, 1-7-1-6-7, 1-7-1-3-2

1-2-1-6-7 transistions down a scale tone, as "C" to "B" below

1-2-1-3-2 transistions up a scale tone, as "C" to "D" below

1-7-1-6-7 transistions down a scale tone, as "C" to "B" below

1-7-1-3-2 transistions up a scale tone, as "C" to "D" below

We will explore "flipping" in this manner from "6", from "8" ("1" up and octave), and from 10 ("3" up an octave).

Pivot Tone

with scalar, arpeggio or chromatic movement, changing notes on or off the beat

Every other note is one particular tone, called the pivot tone. The alternate set of notes in the every-other is a scalar or chromatic ascent or descent to another chord. These can bridge an octave or more. They can incorporate all the previous melodic cells. Chromatic cells must be played quickly to work when alternated with a pivot tone.

Ascend or descend with changing notes on the beat or changing notes off the beat. If scalar, skip to chord tone on "1" as necessary.

Scalar Encircling

CHROMATICIZED ARPEGGIO CELLS

Generally, chromaticizing arpeggios involves one or more of these three actions:

- ✦ fill in between chord tones with half steps
- ✦ fill in chromatically between a neighboring scale tone and a chord tone
- ✦ precede a chord tone from a lower chromatic tone a half step below.

It is preferable to get chord tones on the beat or to push the beat by playing a chord tone before a beat then sustaining onto the beat or putting a rest on the beat

See the chapters “[Chromaticized Arpeggios](#)” and “[Chromaticized Scales on Arpeggios](#)”.

HARMONIC TYPE MELODIC CELLS

Harmonic Cadences

See the chapters [“Voice Leading”](#) and [“Modal II-V-I Cadences and Turnarounds”](#).

Superimposed Chord Progression

See the chapters [“Substitution”](#), [“Melodically Superimposed Cadences”](#) and [“Voice Leading”](#)/Most Usable Voice Leading/Four Beat Cadences.

secondary roots

See the chapter [“Substitution”](#)/Secondary Roots. Melodic cells can be used on the third and sixth with various melodic cells.

the tertian cycle

Tertian implies made of thirds. The interval of a third is counted inclusively, so the interval from scale tone one to scale tone three or from scale tone two to scale tone four are called thirds. Chords are typically constructed in thirds, using the tertian cycle 1-3-5-7-2-4-6-1-3, etc. The tertian cycle harmony Three-note chords built in thirds are called tertian triads. Any four-note tertian chord contains two subset triads. Any five-note tertian chord contains two tertian quadrad subsets and three tertian triad subsets.

triad subsets of each original chord

For each original chord, consider all of its potential versions of ninth and sixth chords. In the major scale, usable ninth chords occur on all scale tones except not seven and three. Sixth chords occur on steps I, IV, V and II. IIm6 is not very usable in cadences like II V I, but more as a tonic chord in a minor key.

Most of the original chords in a progression have potential substitutes based on [secondary roots](#). Secondary roots are on the root, third, fifth or sixth (if the chord has a sixth) of each original chord. Secondary roots on the sixth are primarily used with major chords (C6 used for Cma7 or for C7, not so much for Cm7).

These substitute progressions work best with major scale-tone chords, where there are many options. See the chapters [“Chord-Naming Conventions”](#), [“Major Scale-Tone Triads”](#), [“Scale-Tone Seventh Progression”](#), [“Recognizing Scale-Tone Chords”](#) and [“All Scale-Tone Chords”](#).

use in comping or single-note soloing

First, play substitute progressions in chords. Once you can play these in chordal form, use the same thought to get chord names for neighboring chords that you express with melodic cells and phrases. Think the substitute chords, express them in single notes, all the while listening to its effect against the original chords. So, it helps to play with another musician, a recording or software playing the chords.

Triad cells may be used as secondary roots on the third, fifth, sixth and sometimes the seventh. They are based on thirds, subsets and synonyms. See the chapter “[Substitution](#)”/Shared Thirds: Secondary Roots.

secondary root on the third

A [secondary root](#) on the third of a chord can be used when a four-note chord is built in thirds (tertian quadrad), such as Ima7 (1-3-5-7), IIIm7 (2-4-6-1), or IIIIm7 (3-5-7-2). In each case, the chord without a root becomes a triad its third. Cma7 (1-3-5-7) without a root is 3-5-7, which is a III minor triad. Dm7 (2-4-6-1) without a root is 4-6-1, which is a IV major chord.

The same logic works with five-note chords built in thirds (tertian pentads), such as Ima9 (1-3-5-7-2), IIIm9 (2-4-6-1-3), or IVma9 (4-6-1-3-5). Each chord without a root becomes a seventh chord (tertian quadrad). Cma9 (1-3-5-7-2) without a root is 3-5-7-2, which is a IIIIm7 chord. Dm7 (2-4-6-1-3) without a root is 4-6-1-3, which is a IVma7 chord.

Chords built on III and VII of the major scale imply ninth chord types that are not currently accepted: Im7b9 and VIIIm7b5b9.

Secondary roots on the third of chords in the key of C:

seventh name in C	parent tones	seven no root tones	synonym
Cma7	1-3-5-7	3-5-7	Em
Dm7	2-4-6-1	4-6-1	F
Fma7	4-6-1-3	6-1-3	Am
G7	5-7-2-4	7-2-4	B dim.

secondary root on the sixth

To use a secondary root on the sixth of a chord, it must be chord whose chord scale includes a sixth. In the major scale, this is chords built on I, II, IV or V.

A secondary root on the sixth of a chord can be used when a four-note chord is a triad built in thirds (tertian), *with an added sixth*, such as I6 (1356 or 6135), IIIm6 (2467 or 7246), or IIIIm7 (3572). In each case, the sxith chord is a synonym of a seventh chord (tertian quadrad) built on its sixth.

Secondary roots on the sixth of chords in the key of C:

sixth & synonym	sixth name in C	parent tones	synonym	parent tones	triad of synonym
I6 = VIIm7	C6	1-3-5-6	Am7	6-1-3-5	Am
IIIm6 = VIIIm7b5	Dm6	2-4-6-7	Bm7b5	7-2-4-6	Bdim
IV6 = IIm7	F6	4-6-1-2	Dm7	2-4-6-1	Dm
V6 = IIIIm7	G6	5-7-2-3	Em7	3-5-7-2	Em

major scale-tone secondary root triads in fourths

	VIIIm7b5	IIIIm7	VIIm9	IIm9/6	V9/6	Ima9/6	IVma9/6	I9/6	IV9/6
in C	Bm7b5	Em7	Am9	Dm9/6	G9/6	Cma9/6	Fma9/6	C9/6	F9/6
on sixth				VII dim	IIIIm	VIIm	IIm	VIIm	IIm
on root	VII dim	IIIIm	VIIm	IIm	V	I	IV	I	IV
on third	IIm	V	I	IV	VIIIdim	IIIIm	VIIm	III dim	VI dim

Any sequence of chords with roots ascending in perfect fourths can be substituted with a parallel sequence on the third of each chord. For the series IIm-V-I-IV, a parallel sequence can occur on the sixth of each chord.

Notably, IIm V I can be substituted with VIIIdim-IIIIm-VIIm or VIIIdim-III-VIIm. Conversely, VII dim-IIIIm-VIIm (B dim-Em-Am) can be substituted with IIm-V-I (Dm-G-C). This gives tangible meaning to the concept of relative major and relative minor, using entire relative cadences. These cadences could be called *relative major cadence* and *relative minor cadence*.

For any three triads in fourths, upward stepwise [voice leading](#) can occur beginning on the fifth of the first chord of the three. For example, IIm-V-I (Dm-G-C) can voice-lead major scale tones 6-7-1 (A-B-C), since “6” is the fifth of the IIm chord, “7” the third of the V chord and “1” the root of the I chord.

Flat Five (Tritone) Substitute

See the chapter “[Substitution](#)”/Flat Five Substitute.

Chromatic Passing Chords

IIm and IIIIm can be connected with a chromatic chord in-between, ascending IIm-#IIm-IIIIm (Dm-D#m-Em) or descending IIIIm-bIIIIm-IIm (Em-Ebm-Dm). Likewise, IV and V can be connected, ascending IV-#IV-V (F-F#-G) or descending V-bV-IV (G-Gb-F).

Diminished chords can be used to descend roots a whole step. Follow a major or minor triad with a diminished triad on the same root, then the scale-tone chord down a whole step. V-V dim-IV or IIm-IIdim-I, for example. In ascending a whole step, a major seventh, dominant seventh or minor seventh works better

than a triad, such as V7-#Vdim7-VIm (G7-G#dim7-Am). The triad part works, too, but not as strongly: V-#Vdim-VIm (G-G#dim-Am).

Another way to chromatically connect roots descending a whole step is with a dominant seventh in-between. This is categorized as a flat five substitute (see the chapter “[Substitution](#)”/Flat Five Substitute). IIm7-bII7-I7 is a substitute for IIm-V7-I7, where bII7 is on a root a flattened fifth up or down from the V7 it replaces.

A [flat](#) five substitute is a dominant seventh type chord on a note a half step above the root of the chord it precedes. It doesn't have chromatically connect chord roots a whole step apart (like Dm7-Db7-C7). It can be a single chord preceding another with its root a half step above, like Db7 to C7. For the original chords V7-I7 (G7-C7), the flat five substitute would be bII7 (Db7) and would make the progression bII7-I7 (Db7-C7). It replaces a dominant chord like G7 with one whose root is a flat fifth above or below (which is the same note whether above or below).

ways to chromatically fill in-between:

- ✦ scale-tone triads, up or down. In lieu of drifting scale tone sevenths, use chromatic progressions like the four seventh chord parts of IIm13 to bII13#11 to I13. Connect two minors, major between two majors and otherwise usually fill in chromatically with major.
- ✦ one pentatonic fingering to another, up or down.
- ✦ up or or down with stepwise [1-2-3-5](#) and chromatic passing chords 1-2-3-5 is harmonically stronger than 1-3-4-5.

DECORATION CELLS

MICROTONAL BENDS

Bending a “Sad” Note to a “Happy” Note

Microtonal bends are expressive. Flatted odd number tones $b3$, $b5$, $b7$ and $b9$ suggest darker, sadder moods. Bending any of those tones toward the natural version of the same note brightens the mood and is called a *microtonal bend*.

In tablature, a microtonal bend is shown with a curved arrow and with “1/4” at the tip of the arrow. This suggests that the pitch change is a quarter tone, equal to half a fret in pitch change, such as halfway from flat three to three. The degree of bending should be more discreet than that. In standard music notation, the symbol for a microtonal bend looks like a sickle or a Nike logo.

microtonal bends example - [click to play](#)

The image shows a musical example in 4/4 time with a tempo of 90 bpm. The standard notation is on a treble clef staff. The guitar tablature is on a six-string staff with fret numbers 1 through 8. The melody consists of four measures. Above the notes in the first three measures are labels: $b7$ 5 $b3$ 1, $b7$ 5 $b3$ 1, and $b3$ $b5$ $b7$ 1. The fourth measure has $b9$ 1 $b7$ 5. In the tablature, curved arrows labeled '1/4' point from the fretted notes to the target notes, indicating a quarter-tone bend. The notes are: Measure 1: 8th fret (flat 7), 5th fret (5), 5th fret (flat 3), 1st fret (1); Measure 2: 5th fret (flat 7), 5th fret (5), 5th fret (flat 3), 1st fret (1); Measure 3: 5th fret (flat 3), 6th fret (flat 5), 7th fret (flat 7), 1st fret (1); Measure 4: 6th fret (flat 9), 1st fret (1), 5th fret (flat 7), 5th fret (5).

The little curved line that looks like a Nike logo is the microtonal bend symbol.
 Flat three ($b3$) and flat seven ($b7$) microtonal bends are common.
 Flat five ($b5$) microtonal bends are less common.
 Flat nine ($b9$) microtonal bends are very rare.

If a half step were considered 100%, a quarter tone would be 50%. When applying a microtonal bend to a chord that includes the flatted version of the note the microtonal bend is being applied to, such as a flatted third during a minor chord, the degree of pitch change should be less, about 20-40%. If the pitch change was much over 50%, it would suggest the natural three and would sound out of tune.

In applying a microtonal bend to a chord that includes the major version of the note the microtonal bend is being applied to, such as a natural third during a major chord, the flatted third could be bent up to about 80% or so toward the natural third. Bending 90-100% would no longer be a microtonal bend, but would be a lower chromatic flat three bending up to natural three. In blues style, the microtonal bend played against a major interval like a major third can be very little (30-30%), if you want a bluesy effect. Flatted versions of tones are commonly played against natural versions in blues, $b3$ against 3, $b5$

against 5, flat seven against seven or flat nine against nine. Flat nine microtonal notes work, but are very rarely used.

The Bend Curve

Typical Cells with Microtonal Bends Travel a Scale to a Chord Tone

BEBOP AND BAROQUE ORNAMENTATION

with turn and mordent

Upper Mordent

With an upper mordent, you play a note followed by it's upper neighbor, then return to the original note.

Lower Mordent

With a lower mordent, you play a note followed by it's lower neighbor, then return to the original note.

Turn (Upper Turn)

In playing a turn (an upper turn), you play, in order:

- ✦ the initial note
- ✦ the upper neighbor of the initial note
- ✦ return to the initial note
- ✦ the lower neighbor of the initial note
- ✦ end with the initial note

Inverted Turn (Lower Turn)

In playing an inverted turn (a lower turn), you play, in order:

- ✦ the initial note
- ✦ the lower neighbor of the initial note
- ✦ return to the initial note
- ✦ the upper neighbor of the initial note
- ✦ end with the initial note

THEME AND VARIATION CELLS

By definition, these employing these cells requires two or more cells, in some form of statement and response.

Rhythmic Theme and Variation

Core Melody and Elaboration

Melodic Curve Theme and Variation

(examples here)

This can incorporate all the previous melodic cells. See Theme And Variation/Harmonic Theme And Variation/[The Melodic Curve](#). Build each theme with a cluster of chord tones (on a single chord), up to a ninth chord. Particularly use upper and lower neighbors. Pairs of linear chromatic upper neighbors are great. Melodic theme and variation is typically played on three adjacent strings. The best string set is five, four three, since they are not too bassy and don't involve the tuning change between the third and second string.

Play the same melodic curve on another part of the same larger chord, or on the next chord in the progression. For example, build a theme on the G7 part of G9, then use the same melodic curve and play it on the Bm7b5 part of G9. Usually use the same fingering orientation. If the G7 melodic curve started with the index finger on the root, also start the Bm7b5 with the index finger on its root.

Call And Response

STYLES AS CELLS

Styles may employ a number of cells. Once you become familiar with a style, you can play as briefly as a few beats in the style, making the style a cell of sorts.

Pedal Steel Bends

Charlie Parker Design

Charlie Parker's main designs

- ✦ **Chromatics.** Ascending by preceding a chord tone with one or two chromatic tones immediately below. Descending by following a chord tone with two chromatic tones immediately below it, then playing the next lower chord tone.
- ✦ **Dual melody.** In an imitation of two-voice counterpoint on one instrument, play one or more notes of a melody in the high range of pitch, beginning a second melody with one or more notes in the low range, then alternate between the two ranges.
- ✦ **scalar encircling.** Approaching a chord tone by linear scale movement, but passing it by one scale tone before playing it.
- ✦ **"V" design.** Up/down or down/up with a quick, ornate melodic figure at the peak or valley.
- ✦ **Cadence ornament rhythm.** Short melodic phrases (5-10 notes) involving a mordent or turn that suggest a two-chord cadence. Use more syncopated sixteenths for a more modern sound (Bitches Brew era and later).

Practice getting your melodic performance chord cadences really tight rhythmically. Sometimes you'll want to play phrase loosely placed metrically (not matching the comping chord with the chord you are suggesting), sometimes tight (matching comping and improv chords), exactly on the beat to show the song structure to the listener.

- ✦ **Changed chord quality.** Usually displayed with two consecutive arpeggios, the second one with a flatted tone. Sometimes superimposed where drastically contradicting the original chord.
- ✦ **Staggered core tones and elaboration.** Use a core melody with elaboration such as a core melody of three ascending scale tones with notes between them that lead to each.

Consider this interpretation of the first bar of Charlie's head melody to Anthropology in Bb: he used a core melody with the notes D, Eb and F. Each of those is preceded by a note a third below, making three pairs of notes in thirds. Finally, he inserted a passing scale tone between the first and second pair of thirds (the note "C") and a lower chromatic before the next to last note in the bar.

three scalar encircling fingering categories:

- ✦ the target is fretted with the index finger, so the lower neighbor is on the next larger string with the ring or little finger and the upper neighbor is on the same string with another finger.
- ✦ the target note is fretted with the middle or ring finger where the target, the upper neighbor and the lower neighbor are all on the same string.

- ✦ the target is fretted with the little finger, so the lower neighbor is on the same string with another finger and the upper neighbor is on the next smaller string fretted with another finger.

fingerings for “V” design:

- ✦ In-position major scale fingerings and their three-note-per-string versions for speed. Include their harmonic minor and melodic minor variants. See [Prime Scales, Chords and Arpeggios/Seven Tone Scales in Seven Areas with Tertian Arpeggios in Black and Gray](#).
- ✦ Full-tercian arpeggios, especially minor eleventh and dominant thirteenth

build cadences with cadence ornament rhythms

Using resources like Charlie Parker’s solos in Confirmation, Moose The Mooche, Ornithology, Yardbird Suite, Anthropology and Scrapple From The Apple and apply them to cadences. Put these cadences at the top or bottom of Parker’s “V” design to build a four-bar, “V” design phrase. Learn a cadence. Typical two-chord cadences most commonly start on beat three and end on beat one or sometimes start on beat one and end on beat three. Typical three-chord cadences place the first chord on beat one of the setup bar before the target “I” chord, the second chord on beat three of the setup bar and end on beat one of the target chord.

At the beginning of a four bar phrase, play a scale, arpeggio or combination to ascend or descend to the cadence. The target I chord would typically be on beat one of bar three, on the target chord. Then finish bars three and four with a scale or arpeggio (or combination) to in the opposite direction from the beginning to complete the four-bar “V” design.

The cadence ornament rhythm replaces one of four swing eighth notes with a sixteenth pair or with a sixteenth triplet.

Use the full-tercian concept to locate chord tones of a setup chord. A II chord can be thought of as a setup for a V chord. Then the V chord can in turn be thought of as a setup for the target I chord. bII as a setup to I works similarly to the [full tertian](#) concept but, being a more chromatic chord, it changes scale too much to be thought of in terms of full tertian. However, a bVIm9(ma7)-bII-I cadence can use bVIm9 as an “other full-tercian of bII”. When you are playing an arpeggio in thirds, the notes you are skipping (every-other scale tone) make up the “other full tertian” arpeggio.

Two-Chord Cadences

One setup chord, one target chord. Examples below are for a Bb target I chord. Use the same strategies of practice as in practicing three-chord cadences, but omit the first chord and continue the “lead-in” in place of the first chord.

major V I (F9 to Bbma7 or Bb7)

F9 with its root (F) on the fifth of Bb below the Bb root uses the “other [full tertian](#)” in relation to the target Bb major triad. V9 (F9) to I7 (Bb7) is more harsh than the softer Vm9 (Fm9) to I7 (Bb7).

Mixolydian Vm I (Fm9 to Bb7)

Fm9 with its root on the fifth of Bb (F) below the Bb root uses the “other [full tertian](#)” in relation to the target Bb major (Bb Mixolydian) triad.

bII Lydian dominant to I (B13#11 to Bb)

Any four-note part of B13#11 can resolve to a Bb or Bbm triad part of a larger Bb (or Bbm) chord.

minor V Im (D7 or Dm7 to Gm)

D7b9 with its root (D) on the fifth of Gm below the Gm root uses the “other [full tertian](#)” of G harmonic minor in relation to the target G minor triad. For a softer, cadence, Dm9 with its root (D) on the fifth of Gm below the Gm root uses the “other full tertian” of G Aeolian in relation to the target G minor triad.

Three-Chord Cadences

practicing three-chord cadences

At slower tempos (around 75-130 BPM), use sixteenth notes. Beats three and four of the pickup bar each represent a chord with four-sixteenth notes. Beat one of the next bar is the target chord (the third chord in the three-chord cadence). Replace one or two of those sixteenths with a pair of thirty-second notes or a thirty-second note triplet, making a little flurry.

At faster tempos (130-250 BPM), use eighth notes, beats one and two of the pickup bar has four eighth notes to represent the first chord. Beats three and four of the pickup bar represent the second chord of the cadence. Beat one of the next bar is the target chord (the third chord in the three-chord cadence). Replace one or two of those eighths with a pair of sixteenth notes or a sixteenth note triplet, making a little flurry.

Develop the ability to play continuous fast notes to be prepared when you need it. Practice the whole thing in continuous eighths or sixteenths: the lead-in, the “cap” (cadenced target phrase) and the tail out. Separately, practice the upward or downward lead in to the target on the first beat and the “tail” out immediately after the target tone with continuous sixteenths or eighths (depending on the temp), really tightly in the groove. Many uptempo Pat Martino improvisations use continuous straight sixteenths at

130 BPM. Rude Mood by Stevie Ray Vaughan uses swing eighths at 262 BPM. Crossroads live with Bonamassa and Johnson uses continuous straight sixteenths at 140 BPM.

Placing the phrase against the meter Get your performance of the chord cadence really tight rhythmically. Sometimes you'll want to place the phrase loosely metrically (not matching the comping chord with the chord you are suggesting). Periodically place the phrase with the target chord on "one" to show the song structure to the listener, especially at the end of a section.

Two setup chords, one target chord make a three chord cadence. The examples below are for a Bb target I chord.

"I" can be a temporary key, so "Bb" could be temporarily "I" where it is a target during a piece in a key other than Bb. In the key of F for example, Bb is a IV chord in relation to F, but Bb could be thought of as "I" of a temporary key of Bb.

major II V I

Cm9 F9 Bbma7 or Bb7. Cm9 with its root (C) on the fifth of F, below the F root uses the "other [full tertian](#)" in relation to the F major target triad. In turn, F9 with its root (F) on the fifth of Bb, below the C root uses the "other full tertian" in relation to the Bb major target triad.

II Dorian to bII Lydian dominant to I (Cm9 B13#11 Bbma7, Bb7 or less commonly, Bbm)

Cm9 (IIIm9) with its root (C) on the second of the ultimate target Bb, below the F root uses the "other [full tertian](#)" in relation to the eventual F major target triad. B13#11 can be used in-between the Cm9 and Bb target to make a three chord cadence. Any four-note part of B13#11 can resolve to a Bb or Bbm triad part of a larger Bb (or Bbm) chord.

bVI melodic minor to bII Lydian dominant to I (F#m9(ma7) B13#11 Bbma7 or Bb7)

F#m9(ma7) (bVIIm9<ma7> of Bb) with its root (F#) on the second of the target B13#11, below the B root uses the "other [full tertian](#)" in relation B13#11. B13#11 should in turn resolve to a Bb triad tone.

minor IIIm7b5 V I (Am7b5 to <D7 or Dm7> to Gm)

IIIm7b5 (Am7b5) is nearly the same as V7b9 (D7b9) no root (= F#dim7). Descending the flatted seventh of IIIm7b5 (Am7b5) a half step to six makes it IIm6b5 (Adim7), which is the same notes as IIdim7 (Adim7) and the same notes as V7b9 (D7b9) no root. V7b9 (D7b9) no root has four diminished seventh names in relation to the I minor key (G minor): VIIdim7, IIdim7, IVdim7 and bVIIdim7 (F#dim7, Adim7, Cdim7 and Ebdim7). So, IIIm7b5 to V7b9 is a more passive chord change, since it only changes one note.

D7b9 no root is D7b9 no root (F#dim7), with its third (F#) on the seventh of G harmonic minor below the Gm root uses the "other [full tertian](#)" of G harmonic minor in relation to the target G minor triad.

For a softer, cadence, Dm9 no root with its b3 (F) on the flatted seventh of G Aeolian uses the “other full tertian” of G Aeolian in relation to the target G minor triad.

minor bVI^{13#11} V Im (Eb13#11 to D7 to Gm

bVI^{13#11}(Eb13#11) is a bII of V7 (D7). Any four-note part of bVI13#11 (Eb13#11) can resolve to a V (D) triad part of a V7b9 or chord except the #11 (A) of bVI13#11 which is a common tone of V (D).

The remainder of the cadence, V Im is described above in the Two-Chord Cadences section (MINOR V Im).

Fragment Patterns

- **Numbered, Repeating Groups of Notes**
- **Beat Obscuring**
 - Rhythmic Displacement
 - Anti-Metric Grouping
- **Consecutive Fragment Pattern Cells**
- **Triads in Fourths**
- **Triad with Neighbor Cells 1-2-3-5 and 1-3-4-5**
- **Don't Overuse Fragment Patterns**

NUMBERED, REPEATING GROUPS OF NOTES

Fragment patterns are expressed in numbers, in a generic manner. The numbers express the order of notes played in scale or arpeggio. The number sequence can begin on any note in the scale or arpeggio. Flats or sharps are not used to prefix the numbers (b3, #5, etc.), since the distances between once scale tone and another are not considered.

Whole steps are two frets, meaning from a particular starting note, the note up a whole step would be on a fret numbered two higher than the original note. “C” is on the fifth string, third fret. “D” is a whole step higher and is on the fifth fret, which adds the number “two” to the third fret. A half step is one fret: if “B” is on the second fret, “C” would add one and be on the third fret.

For the fragment pattern “1-2-3”, for example, it would ascend half step-whole step if applied to a C major scale starting on “E”, making the letter sequence E-F-G (E to F is a half step and F to G is a whole step). If the same fragment pattern were applied to a C major scale starting on “C”, the letter sequence would ascend whole step-whole step.

Fragment patterns can be applied to each note of a scale ascending or descending. Fragment patterns using the notes of a scale can be played on each tone of a scale or on each tone of an arpeggio. Fragment patterns using the notes of an arpeggio can be played on each tone of a scale or on each tone of an arpeggio.

Fragment Pattern Rules

the numbering system

Fragment patterns can be expressed in numbers. They can be applied to pentatonic (five tone) scales, heptatonic (seven tone) scales or to arpeggios. They are most commonly three or four consecutive notes (1-2-3 or 1-2-3-4), but using five or six consecutive notes (1-2-3-4-5, 1-2-3-4-5-6) is particularly useful in beat obscuring. Expressing fragment patterns in numbers as 1-2-3, 1-2-3-4, 1-2-3-4-5 or 1-2-3-4-5-6 represents those choices from a consecutive series of notes on whatever scale or arpeggio you are playing.

For illustration, consider the A Aeolian scale, with the ascending A-B-C-D-E-F-G-A-B, etc. 123 would be A-B-C, B-C-D, C-D-E, etc., depending on which note it starts. A 123 fragment pattern cell applied to each tone in ascending the A Aeolian scale would be A-B-C, B-C-D, C-D-E, D-E-F, E-F-G, F-G-A, G-A-B, A-B-C, etc.

retrograde inversion (reverse order)

A fragment pattern can be played in reverse order, called “retrograde inversion”. “1-2-3” can be played in reverse order as “3-2-1”. Either “1-2-3” or “3-2-1” can be played on each note of the scale or arpeggio, ascending or descending. If you wrote the original melodic line in music notation or tab, playing it in

retrograde inversion would constitute starting with the last note and reading right to left as you read and play.

Whimsical Application

You could also apply a fragment pattern whimsically to any arpeggio tone, *not* ascending order the arpeggio tones in order to which you apply the fragment pattern. Good results are less likely if you whimsically apply fragment patterns to scale tones, since you may deviate too far from the current chord in doing so.

BEAT OBSCURING

The beat is not obscured when the same fragment pattern is played on each beat. The beat is obscured when the fragment pattern pitch group does not reoccur on every beat.

Beat obscuring is intentionally misaligning the melody with the accompaniment chord by not placing the current chord tone on the beat.

When the note on the beginning of a beat following a fragment pattern is a current chord tone, it strongly references the chord sound and make the melody sound “in harmony” with the chord. Too much of this, however, can make the music too predictable and boring. To make the music more interesting and free sounding, improvisers often intentionally do not resolve on the beat, and then they periodically do resolve to a chord tone on the beat. This shows the listener that the music has good form and periodically aligns the chord sound in the improvisation to the accompaniment, but not so often as to weaken the free nature of the improvisation.

Eric Johnson and Joe Bonamassa in blues rock, Pat Martino and George Benson in jazz and others have become expert at using fragment patterns to obscure the beat, making the music more abstract.

Beat obscuring is most effectively done by starting fragment patterns on random parts of the beat and by mixing different fragment patterns. The trick is to keep part of your consciousness focused on when the next beat “one” will be coming up, so you can resolve to a chord tone on it.

Beat obscuring is best applied to scalar and harmonic fragment pattern cells. It gets harder to conceive in applying it to triad with neighbor cells. Though it can work with triad with neighbor cells, it is less fruitful, so apply beat obscuring to scalar and harmonic fragment pattern cells first.

Rhythmic Displacement

Rhythmic displacement is beat-obscuring misalignment of a melodic cell or theme to the beat. Usually, this is intentional. Fragment patterns can be rhythmically displaced so they start on different parts of the bar.

One device for beat obscuring is rhythmic displacement which moves a musical part forward or backward in time. We will be doing this in the context of moving a series of fragment pattern cells played with notes of equal time value (all eighth notes, all eighth triplet notes, all sixteenth notes, etc.) back in time, by a number of notes. Each of these beat divisions could be called a “pulse”. In 4/4 time (or 3/4, or any number in a time signature over 4), eighth notes are two pulses per beat, eighth note triplets are three pulses per beat, sixteenth notes are four pulses per beat and sixteenth note sextuplets are six pulses per beat.

Consider a part where a fragment pattern series starts on the first beat and has all notes of equal time value. By moving the fragment pattern series one pulse (one note) back in time, the second note of the series will start on the first beat. That would have the same effect as starting the series on the last pulse before the first beat, as a pickup. Moving the part two pulses back in time would put the third note of the series on the first beat and would be like playing a two-note pickup.

When we hear such rhythmic displacement, we aurally reevaluate the part in the context of what happens on each beat. In a sense, this makes a new melody.

Anti-Metric Grouping

Another device for beat obscuring is anti-metric grouping puts the notes in groups with a different number of notes in each group compared to the number of notes on each beat. When the number of notes in the fragment pattern is different from the number of notes per beat, a new melodic pattern is born. When the number of notes in a fragment pattern differs from the number of notes per beat, it is called *anti-metric grouping*.

The number of notes in a fragment pattern such as three notes in “1-2-3” fragment don’t necessarily have to be played with the same number of notes per beat. For example, the 1-2-3 fragment pattern cell groups notes in threes. If the 1-2-3 fragment is played in a repeating series in sixteenth notes, there would be three notes in each group by pitch, yet four notes per beat. When we aurally reevaluate the part in the context of what happens on each beat, we conceive a new melodic theme which repeats every twelve notes (three notes per group times four notes per beat).

A 1-2-3-4 fragment pattern cell groups notes in fours. If the 1-2-3-4 fragment is played in a repeating series in eighth note triplets (three notes per beat), there would be four notes in each group by pitch, yet three notes per beat. When we aurally reevaluate the part in the context of what happens on each beat, we conceive a new melodic theme which repeats every twelve notes (four notes per group times three notes per beat). The twelve note series of 1-2-3 played in sixteenths makes a different melodic design than the twelve notes series of 1-2-3-4 played in triplets.

4-3-2-1 descending

The first system of the musical score for 'The Rose Tree' is shown. It consists of a vocal line and a guitar line. The vocal line is in 4/4 time and begins with a whole rest, followed by a melody of eighth and quarter notes. The guitar line is in standard tuning and provides a harmonic accompaniment using a sequence of numbers (5, 8, 6, 5, 8, 6, 5, 7, 6, 5, 7, 5, 5, 7, 5, 8, 7, 5, 8, 7, 5, 8, 7, 5, 8, 7, 5, 8, 7, 5, 5, 8, 7, 5).

4-3-2-1 descending, rhythmically displaced to put the SECOND NOTE ON THE BEAT.

Note the new "3-2-1-3" pattern every two beats (separated by dotted vertical lines).

1-3 (thirds)

“1-3” played stepwise makes pairs of every other note. When ascending a major scale or other seven-tone (heptatonic) scale, “1-3” makes pairs of ascending thirds. With the 1-3 fragment cell in reverse order is “3-1”.

TRIAD WITH NEIGHBOR CELLS 1-2-3-5 AND 1-3-4-5

1-2-3-5 and 1-3-4-5 fragment pattern cells are based on heptatonic (seven-tone) scales, such as major, harmonic minor or melodic minor. They each are a triad of three notes in thirds (1-3-5) with an added tone. The added tone is either “2” or “4”.

The page contains six systems of musical exercises, each with a treble staff and a bass staff. The exercises are numbered 30 through 42. Each system includes a melodic line in the treble staff and a harmonic line in the bass staff. Fingerings are indicated by numbers 1-4 for the first system, 1-5 for the second, 1-6 for the third, 1-7 for the fourth, 1 for the fifth, and 1-3 for the sixth. The exercises are in 2/4 time and use a mix of eighth and sixteenth notes. The page is numbered 30 to 42 in increments of 2.

Musical score for "The Sound of Silence" by Simon & Garfunkel. The score is for guitar, showing the first two measures. The key signature is one sharp (F#), and the time signature is 4/4. The first measure contains a Dm chord and the second measure contains a Gm chord. The melody is written on a single staff, and the guitar tablature is written below it. The tablature shows the fret numbers for each string (T, A, B) and includes a capo symbol at the first fret.

combined 1-2-3-5 & 1-3-4-5 examples

"G" Mixolydian - up 1-2-3-5, down 5-4-3-1 on Em (G6 no 5) and G9 triad subsets

The first system of the musical score is in 4/4 time. It features a treble clef and a key signature of one flat (Bb). The melody is written on a single staff. Above the staff, the chords Em, G, B°, and Dm are indicated. The melody consists of eighth and quarter notes, with some phrases beamed together. The system ends with a double bar line and a repeat sign.

"G" Dorian - up 1-2-3-5, down 5-4-3-1 on Em (G6 no 5) and Gm9 triad subsets

"G" Mixolydian - up 1-3-4-5, down 5-3-2-1 on Em (G6 no 5) and G9 triad subsets

Musical notation for the "G" Mixolydian scale pattern. The notation is in 4/4 time, featuring a treble clef and a key signature of one flat (Bb). The scale is played in four measures, each with a specific chord indicated above it: Em, G, B°, and Dm. The first measure (Em) shows the ascending pattern 1-3-4-5. The second measure (G) shows the descending pattern 5-3-2-1. The third measure (B°) shows the descending pattern 5-3-2-1. The fourth measure (Dm) shows the descending pattern 5-3-2-1. Below the staff, the fretboard positions for the strings T, A, and B are indicated with numbers 1 through 5.

"G" Dorian - up 1-3-4-5, down 5-3-2-1 on Em (G6 no 5) and Gm9 triad subsets

Musical notation for the "G" Dorian scale pattern. The notation is in 4/4 time, featuring a treble clef and a key signature of one flat (Bb). The scale is played in four measures, each with a specific chord indicated above it: Edim., Gm, Bb, and Dm. The first measure (Edim.) shows the ascending pattern 1-3-4-5. The second measure (Gm) shows the descending pattern 5-3-2-1. The third measure (Bb) shows the descending pattern 5-3-2-1. The fourth measure (Dm) shows the descending pattern 5-3-2-1. Below the staff, the fretboard positions for the strings T, A, and B are indicated with numbers 1 through 5.

1-2-3-5 on Melodic Minor IV Examples

E form bII9 (Db9 to C, using Ab melodic minor)

1-2-3-5 on the root, third and fifth; 1-2-3-4 on the b7

Fretboard diagram for E form bII9 (Db9 to C) using Ab melodic minor. The diagram shows a 6-string fretboard with the following fingerings: 1 (index) on the 1st string, 2 (middle) on the 2nd string, 3 (ring) on the 3rd string, 4 (pinky) on the 4th string, 1 (index) on the 5th string, and 2 (middle) on the 6th string. The fretboard is divided into four boxes, each containing a 1-2-3-5 pattern on the root, third, and fifth, and a 1-2-3-4 pattern on the b7.

Musical staff for E form bII9 (Db9 to C) using Ab melodic minor. The staff shows the melodic line in Ab melodic minor (4 flats) with a key signature of three flats. The notation includes a treble clef, a 4/4 time signature, and a key signature of three flats. The melody is written in a 4/4 time signature. The tablature below the staff shows the fret numbers for each note: 9 11, 8 11, 8 10 11, 9, 11, 8, 9, 8, 9 11, 8 10, 11, 8 10, 9, 10, 9, 7, 9 11, 7 11, 7, 9 11, 13.

Musical staff for E form bII9 (Db9 to C) using Ab melodic minor. The staff shows the melodic line in Ab melodic minor (4 flats) with a key signature of three flats. The notation includes a treble clef, a 4/4 time signature, and a key signature of three flats. The melody is written in a 4/4 time signature. The tablature below the staff shows the fret numbers for each note: 4 4 2 1 4 1 4 2, 1 2 1 3 2 3 1 4, 3 1 4 2 1 2 1 4, 2 4 3 1 4 1 4 2, 13 11 9, 7 11 7, 11 9, 7, 9 8, 10 9, 10 8, 11, 10 8, 11 9, 8, 9 8, 11, 9, 11 10 8 11 8, 11 9.

A form bII9 (Gb9 to F, using Db melodic minor)

1-2-3-5 on the root, third and fifth; 1-2-3-4 on the b7

Fretboard diagram for A form bII9 (Gb9 to F) using Db melodic minor. The diagram shows a 6-string fretboard with the following fingerings: 1 (index) on the 1st string, 2 (middle) on the 2nd string, 3 (ring) on the 3rd string, 4 (pinky) on the 4th string, 1 (index) on the 5th string, and 2 (middle) on the 6th string. The fretboard is divided into four boxes, each containing a 1-2-3-5 pattern on the root, third, and fifth, and a 1-2-3-4 pattern on the b7.

Musical staff for A form bII9 (Gb9 to F) using Db melodic minor. The staff shows the melodic line in Db melodic minor (5 flats) with a key signature of four flats. The notation includes a treble clef, a 4/4 time signature, and a key signature of four flats. The melody is written in a 4/4 time signature. The tablature below the staff shows the fret numbers for each note: 9 11, 7 11, 7 9 11, 8, 9 11, 8 11, 8 10 11, 9, 11, 8, 9, 9 11, 9 11, 11, 9 11, 11, 8, 9, 12.

Musical staff for A form bII9 (Gb9 to F) using Db melodic minor. The staff shows the melodic line in Db melodic minor (5 flats) with a key signature of four flats. The notation includes a treble clef, a 4/4 time signature, and a key signature of four flats. The melody is written in a 4/4 time signature. The tablature below the staff shows the fret numbers for each note: 4 2 1 4 2 4 2 4, 4 2 4 2 2 2 1 4, 2 4 3 1 4 1 4 2, 1 4 2 1 4 1 4 2, 12 9 8, 11 9, 11 9, 11, 11 9, 11 9, 9 8, 11, 9, 11 10 8 11 8, 11 9, 8, 11 9, 7 11 7, 11 9.

DON'T OVERUSE FRAGMENT PATTERNS

Keep aware of the listener's experience. Don't get carried away in playing fragment patterns if there is no melodic purpose. Keep consecutive fragment patterns of the same type down to two or three consecutive instances. More than that may make the music too predictable for the listener.

Sometimes, a longer repetition of fragment patterns is warranted. Jimmy Page used a sequence of nine 3-2-1 fragments in the outro solo to Good Times, Bad Times, but there was a little variation and he didn't commonly use fragments in that repetitive manner in his solos.

Bach used a lot of fragment patterns, such as in Brandenburg Concerto 3, but always kept stimulating the listener with theme and variation.

SCALE-TONE THIRDS AND SIXTHS WITH TONIC TRIADS

Movable Thirds and Sixths

Thirds are shown in this section (Movable Thirds and Sixths) only on strings three and two, where they are easiest to fret. Likewise, sixths are shown in this section only on strings three and one and on strings four and two, where they are easiest to fret.

“Tracking” the Scale

With thirds, number the scale tones on the larger of the two strings and keep “track” of it on that string. With sixths, number the scale tones on the smaller of the two strings and “track” it on that string.

Thirds and Sixths in All Keys

For thirds, read a circle below in clocwise order. For sixths, read a circle in couter-clockwise order. In each of the three pairs of enharmonic keys C and Db, F# and Gb, B and Cb, the pitches are the same, but given different names.

Major (Ionian) Thirds & Sixths with Tonic Major Triads

Thirds on strings
three and two

sixths on strings
three and one

sixths on strings
four and two

The circled note (O) represents the major (Ionian) tone center. The three-note chords are the tonic chord, which is the major chord named after the key. If the key (O) is "A", the three-note chords are A major.

An interval of a third is not part of this major chord: . In that case, this fourth can be used in place of a third for tonic major chord tones.

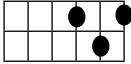

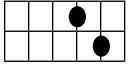

An interval of a sixth is not part of this major chord: . In that case, this fifth can be used in place of a sixth for tonic major chord tones.

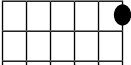

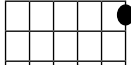

An interval of a sixth is not part of this major chord: . In that case, this fifth can be used in place of a sixth for tonic major chord tones.

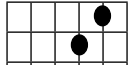

Lydian Thirds & Sixths with Tonic Major Triads

The circled note (O) represents the Lydian tone center. The three-note chords are the tonic chord, which is the major chord named after the key. If the key (O) is "A", the three-note chords are A major.

An interval of a third is not part of this major chord: . In that case, this fourth  can be used in place of a third for tonic major chord tones.

An interval of a sixth is not part of this major chord: . In that case, this fifth  can be used in place of a sixth for tonic major chord tones.

An interval of a sixth is not part of this major chord: . In that case, this fifth  can be used in place of a sixth for tonic major chord tones.

An interval of a third or sixth made with the circled tone center are part of various Lydian tonic chords (major sixth, major seventh and major ninth). The gray-backed notes are the remaining notes *not* in any usable type of tonic Lydian major chord (except suspended chords).

Lydian Thirds & Sixths with Tonic Major Triads

major scale-tone thirds on pairs of strings

Each of the five linear sequences shown on movable diagrams above show a major scale on the larger of the two strings moving up and down the fretboard. The circled note on each of the larger strings of each pair is major scale tone one, the note that names the major scale. With strings three and four, for example, locate the circled note on the fourth string at the fourth string, fifth fret “G”. Progressing down the diagram would emulate going up the fretboard toward the body of the guitar.

Number the sequence of tones with “G” as “1” and follow the sequence of notes down the string (toward the guitar body). Notice that scale tones 3 to 4 and 7 to 8 are one fret apart (no note between them), and all other consecutive pairs of numbered tones are two frets apart (with a “skipped” note between them).

There are two common interval types for thirds: major thirds and minor thirds. On strings 2 and 3, when two notes are on the same fret, the interval is a major third, connected with a horizontal line. Notes on strings 2 and 3 are on adjacent frets (45 degree line between), then they are minor thirds.

On any of the other consecutive pairs of strings (1 & 2, 3 & 4, 4 & 5 or 5 & 6), the pairs on adjacent frets (with a 45 degree diagonal line) are a major third. When pairs skip a fret (connected with a line like the hour hand at 1:30 on a clock), they are minor thirds.

major scale-tone sixths on pairs of strings

strings 4 and 6

strings 3 & 5

strings 2 & 4

strings 1 & 3

Each of the four linear sequences shown on movable diagrams above show a major scale on the smaller of the two strings moving up and down the fretboard. The circled note on each of the larger strings of each pair is major scale tone one, the note that names the major scale. With strings one and three, for example, locate the circled note on the first string at the fifth fret “A”. Progressing down the diagram would emulate going up the fretboard toward the body of the guitar.

Number the sequence of tones with “A” as “1” and follow the sequence of dots representing notes moving down the string (toward the guitar body). Notice that scale tones 3 to 4 and 7 to 8 are one fret apart (no note between them), and all other consecutive pairs of numbered tones are two frets apart (with a “skipped” note between them).

On string sets 1 and 3 or 2 and 4, note pairs on the same fret are major sixths and note pairs on adjacent frets are minor sixths. On string sets 3 and 5 or 4 and 6, note pairs with the greater angle (45 degree, like the hour hand at 1:30 on a clock) are major sixths and note pairs with the lesser angle (like 1 o’clock) are minor sixths.

DIADS

Are Two Simultaneous Notes and Intervals or a Chord?

A two-note chord is called a *diad*. A three-note chord is called a *triad*, four-notes a *quadrad*, five notes a *pentad*, six notes a *sextad* and a seven-note chord is called a *heptad*. It is not universally agreed that two notes are a chord, though. I like to think they are a two-note chord, because two notes played at the same time function like a chord by establishing a chord color. We don't have common names for diads (two-note chords), so we have to use interval names.

A minor third is a two-note chord (diad) whose notes are one and a half steps or three frets apart. Minor thirds have a sad quality, like minor chords. A major third is a two-note chord whose notes are two whole steps (four frets) apart. Any interval can make up a diad, but thirds and sixths are most common.

musical notation for diads on a guitar fretboard, showing intervals from minor second to perfect octave. The notation includes a treble clef, a key signature of one flat (Bb), and a series of notes on a single staff. Below the staff, the interval names are listed: minor second, major second, augmented second, minor third, major third, perfect fourth, augmented fourth, diminished fifth, perfect fifth, augmented fifth, minor sixth, major sixth, augmented sixth, minor seventh, major seventh, and perfect octave. Below the interval names, the fret numbers for the notes are provided: 4, 5, 6, 6, 7, 8, 9, 9, 5, 6, 6, 7, 8, 8, 9, 5.

musical notation for diads on a guitar fretboard, showing intervals from minor ninth to perfect fifteenth. The notation includes a treble clef, a key signature of one flat (Bb), and a series of notes on a single staff. Below the staff, the interval names are listed: minor ninth, major ninth, augmented ninth, minor tenth, major tenth, perfect eleventh, augmented eleventh, diminished twelfth, perfect twelfth, augmented twelfth, minor thirteenth, major thirteenth, augmented thirteenth, minor fourteenth, major fourteenth, and perfect fifteenth. Below the interval names, the fret numbers for the notes are provided: 6, 7, 8, 8, 5, 6, 7, 7, 8, 9, 9, 5, 6, 6, 7, 8.

Major and Minor Thirds and Sixths

major and minor thirds

A major third is equivalent to the interval from the first to third steps of a major scale. A minor third is one half step smaller, made by raising the lower-pitched note or lowering the upper-pitched note. So, it is the interval from one to flat three or from sharp one to three of a major scale.

C major scale steps 1 through 3 major third minor thirds

T
A
B

8 5 7 8 5 7 4 5 8 5 7 7 8 6 7

major and minor sixths

A major sixth is the same as the interval from the first to sixth step of a major scale. A minor sixth is a half step smaller, made by raising the lower-pitched note or lowering the upper-pitched note. It is the interval from one to flat six or from sharp one to six of a major scale.

C major scale steps 1 through 6 major sixth minor sixths

T

B

8 5 7 8 5 7 4 5 8 5 7 8 5 7 7 8 6 7 8 9

Inverting Thirds and Sixths

the magic number nine

To figure out the inversion of any interval less than an octave, subtract the interval from the number “nine”, then change the quality. With perfect fourths or perfect fifths, they remain “perfect” when inverted, which means (for one thing) that they are in each others major scale.

a second plus a seventh is an octave	a third plus a sixth is an octave	a fourth plus a fifth is an octave	a fifth plus a fourth is a ninth
-----------------------------------------	--------------------------------------	---------------------------------------	-------------------------------------

T	5	5	10	7	7
B	5	5	10	10	10

an octave minus a seventh is a second	an octave minus a sixth is a third	an octave minus a fifth is a fourth	an octave minus a fourth is a fifth
------------------------------------------	---------------------------------------	----------------------------------------	----------------------------------------

T	5	5	5	5	5
B	8	5	8	8	8

inverting thirds and sixths changes the quality

Intervals from one of a major scale to two, three, five, six or seven (all the intervals under an octave except four and five) are all called *major*. Flattening the upper note of any of those intervals changes it to minor.

Thirds can be “inverted” by raising the lower-pitched note an octave or lowering the upper-pitched note an octave. In either case the interval becomes a sixth and is the opposite quality of the third. Inverted major thirds are minor sixths. Inverted minor thirds are major sixths. Major sixths invert to minor thirds and minor sixths to major thirds.

THIRDS ON STRINGS THREE & TWO: TEXT VERSION

The A Major Scale

the A major scale by letter and number on the third string

Here is the A major scale on the third string for one octave.

	A	B	C#	D	E	F#	G#	A
	1	2	3	4	5	6	7	1
T	2	4	6	7	9	11	13	14
A								
B								

A whole step is an increase or decrease of two frets, like frets two to four. A half step is one fret, like frets three to four. The major scale ascends from step one through eight with this pattern of whole and half steps: whole-whole-half-whole-whole-whole-half.

A “whole-whole-half” sequence is a tetrachord, four consecutive notes on a seven tone scale. You could say the major scale is two whole-whole-half tetrachords separated by a whole step. Tetrachords most commonly have two whole steps and one half step, but steps four through seven of the major scale make the “whole-whole-whole” tetrachord.

Where notes repeat inclusively eight notes higher or lower, the interval is called an octave. On a single string, octaves are an increase or decrease of twelve frets. So A on the second fret is mirrored by A an octave higher at the fourteenth fret, B at the fourth and sixteenth frets, C# at the sixth and eighteenth and so on. The entire set of notes that make up the A major scale from the A at the second fret to the A at the fourteenth fret would repeat from frets 14 to 26, if you had that many frets.

the A major scale by letter and number on the second string

Now, we’ll duplicate the notes from the A major scale on the third string from its third step up an octave. On the third string, this ascends steps three through three (C#-D-E-F#-G#-A-B-C#) on the sixth through eighteenth frets. The same notes on the second string are four frets lower on frets two through fourteen. See below.

Making Thirds

pairing the notes in thirds

The cycle of thirds is a pattern of every other note in a seven tone scale. A cycle of thirds can be called the *tertian cycle* and a seven tone scale like the major scale can be called a *heptatonic scale*. Thirds are pairs of notes in the cycle of thirds. The cycle of thirds in numbers and in letters is shown below. The letters are shown with "F#", "C#" and "G#", since those notes are sharp in the A major scale.

A									2	4	6	7	9	11	13	14
B																

major and minor thirds are diads

The intervals between notes on the diagrams above are shown in frets, so they relate to the guitar. The frets between these two scale tones is figured by the difference between the fret numbers for the two notes. So notes on the fifth and ninth frets constitute an interval of four frets. A four-fret interval is a major third. A three fret interval is a minor third.

As you can see on the diagrams, four-fret intervals occur in three places: from one to three, four to six and from five to seven. These three are major thirds. So, major thirds ascend from major scale tones one, four and five. Three-note chords built in thirds are called tertian triads (1 -3-5 makes a I major triad). You may know that major triads occur on major scale tones one, four and five, paralleling the major thirds that occur on major scale tones one, four and five.

The three fret intervals called minor thirds occur on the other four tones: two, three, six and seven. This parallels the triads built the major scale, except step seven is a minor third, but a diminished triad.

So, major thirds occur on steps one, four and five. All the rest are minor thirds (two, three, six and seven).

ease of fingering on the third and second string

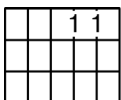

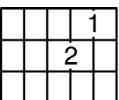

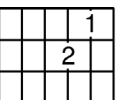

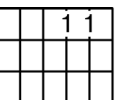

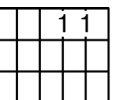

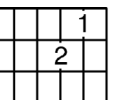

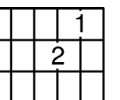

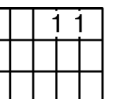

Due to the irregular tuning between the third and second string, thirds are fingered uniquely on those strings. A major third is a two-string barre. A minor third is a diagonal shape with the higher-pitched note one fret lower on the second string.

“track” thirds on the larger string

Thirds are named major and minor in relation to the lower-pitched note on the larger string of the adjacent pair they are played on. Tracking on the third string, means orient to the numbered tones on the third string.

graphic orientation

Thinking in numbers and letters can be challenging. Recognizing graphic patterns can be very useful. Notice that major scale tones four and five are both major thirds, barred on the third and second string. So, you have barres at tones 1, 4 and 5. In-between 1 and 4 (ascending) and in-between 5 and 1 (ascending), there are two minor thirds. Memorize this graphic pattern (major thirds boxed).

letter	A	B	C#	D	E	F#	G#	A

triad-based music

In major key music like Appalachian music (bluegrass, fiddle tunes), country, American folk music, which are harmonically based on western European music British and celtic folk songs major chords are primarily depicted as major triads with an occasional secondary chord tone, the sixth.

The primary scale tones in major triad-based music are those of the major pentatonic with the fourth added as a neighboring tone but not so much as a scale tone. The seventh is rarely used on major chords, unless a blues style is desired. Chromatics and the flatted seventh tend to suggest ragtime, blues and jazz.

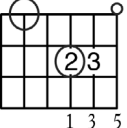

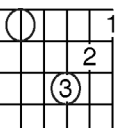

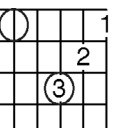

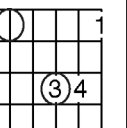

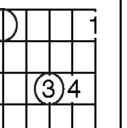

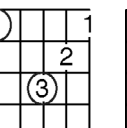

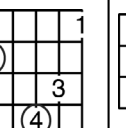

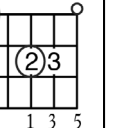

Thinking in the "A" Major Parent Scale

Parent scale numbering allows you to multi-purpose a major scale and use it for a number of different modes, seeing their common basis.

Using the A major scale, can create an E chord for use in the key of E Mixolydian on the fifth step of "A", the minor key of B Dorian on the second step of "A", the minor key of F# Aeolian on the sixth step of "A" or the major key A Ionian (major) on the first step of "A". All of these use the A major scale and all its scale-tone chords, but each one establishes a particular one as the ending chord or key, such as an Bm chord for B Dorian.

A major scale-tone triads on strings 1-3, tracking on the third string

major triads are in boxes

letter	A	B	C#	D	E	F#	G#	A
number	1	2	3	4	5	6	7	1
triad	major	minor	minor	major	major	minor	diminished	major
A major numbers	1-3 -5	2-4-6	3-5-7	4- 6-1	5-7-2	6-1-3	7-2-4	1-3 -5
scale-tone triads	A I 	Bm II 	C#m IV 	D V 	E VII 	F#m IX 	G#dim X 	A I 
E Mixo. numbers	4- 6-1	5-b7-2	6-1-3	b7-2-4	1-3-5	2-4-6	3-5-b7	4- 6-1
B Dor. numbers	b7-2-4	1-b3-5	2-4-6	b3-5-b7	4-6-1	5-b7-2	6-1-b3	b7-2-4
F# Aeol. numbers	b6-1-b3	b7-2-4	1-b3-5	2-4- b6	b3-5-b7	4-6-1	5-b7-2	b6-1-b3

Modal Key Scale Numbering

Modal key numbering may work best for you graphically on the guitar at first, memorizing the patterns of thirds and related chords.

When “1” of the major scale is not the key, re-numbering the mode with “1” on whichever note is assigned as the tone center is better to think while you’re playing or working up parts. I’ll call that “modal key scale numbering”. With modal key numbering, common chords always use the same numbered tones of the key. If the chord progression uses a IV major chord, it is always 461, as in the major scale. If the chord progression uses a I major chord it is still 135. So in E Mixolydian, even though it is using A major scale tones 5 7 2 to build an E major chord, it is numbered 1 3 5 in E Mixolydian, because E is now one.

Think the Sequences Generically

portable triads

The order of triads built on the major scale, ascending step one to one are major-minor-minor-major-major-minor-diminished. There’s a major chord, then two minors, then two majors, then minor and diminished. That’s major mode.

In Mixolydian, use b7. Start on the second of the two major chords in a row, the one that is V major in major mode. Ascend from there: major, minor diminished, major, two minors, then two majors, ending at the octave.

In Dorian, use b3 and b7. Start on the first of the two minor chords in a row, the one that is II minor in major mode. Ascend from there: two minors, two majors, minor diminished, major, back to minor at the octave.

See [Modal Major Scale-Tone Chords](#).

portable thirds

It’s simpler than triads for thirds. There are three major thirds and two adjacent pairs of minor thirds. In major, the major thirds are at 1, 4, 5. In Mixolydian, the major thirds are at b7, 1, 4. In Dorian, the major thirds are at b3, 4, b7. In Aeolian, the major thirds are at b3, b6 and b7.

See [Chords Implied By Heptatonic Thirds And Sixths](#).

Thinking in the Mode E Mixolydian

major triads are in boxes

numbers in D Dorian	b7-2-4	1-b3-5	2-4-6	b3-5-b7	4-6-1	5-b7-2	6-1-b3	b7-2-4

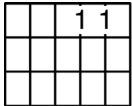

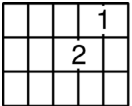

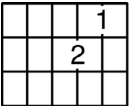

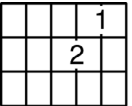

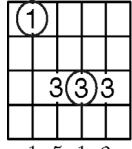

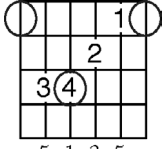

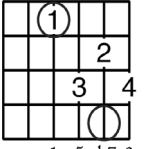

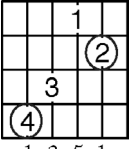

chords suggested by E Dorian thirds

I'm numbering in E Dorian. This uses the D major parent scale. Thirds suggest the following chords:

letter	E	F#	G	A	B	C	D
number	1	2	b3	4	5	6	b7
third	minor	minor	major	major	minor	minor	major
thirds numbers	1-b3	2-4	b3-5	4-6	5-b7	6-1	b7-2
	VIII	XI	XII	II	III	V	VII
I chords	Em VII		Em XII		Em7 II	Em6 V	Em9 V
I chord numbers	1-3-5		1-3-5		1-3-5-b7	1-3-5-6	1-3-5-b7-9
IV chord	A7 VII	A6 X		A XII		A V	
IV chords numbered in the key of I	4-6-1-b3	4-6-1-2		4-6-1		4-6-1	

using a fourth when a third won't work

If you are playing a style that demands staying more strictly on the triads without an added harmony like a sixth or seventh, you'll find there's a gap in the scale from tones three through eight without an available third to use on the chord. This problem can be solved by using tones 5 and 1, instead of five and seven. The third above scale tone five is seven, which would make a major seventh chord sound. If you need to stay with triads, use a fourth with tones 5 and 1 instead.

numbers	1-3	3-5	5-b7	5-1
	IX	XII	III	IV
				
I chords	E VII	E XII	E7 II	E IV
				
	1 5 1 3	5 1 3 5	1 5 b7 3	1 3 5 1

THIRDS ON STRINGS THREE & TWO: VIDEO VERSION

the A major scale by letter and number on the third string

[video link](#)

A major scale ascends seven different tones, then the eighth one has the same name as the first one. In numbers, this is one through one.

Numbering the tones of the A major scale on the third string, each numbered tone to the next is two frets except three to four and seven to eight, which are each one fret.

A whole step is two frets. A half step is one fret.

The major scale ascends from step one through eight with this pattern of whole and half steps: whole-whole-half-whole-whole-whole-half.

The major scale could also be conceived as two whole-whole-half tetrachords separated by a whole step.

In A, the letter names are A-B-C#-D-E-F#-G#-A.

the A major scale by letter and number on the second string

Now, we'll duplicate the notes from the A major scale on the third string from its third step up an octave. On the third string, this ascends steps three through three on the sixth through eighteenth frets. The same notes on the second string are four frets lower on frets two through fourteen.

pairs of notes in thirds

[video link](#)

Now, we'll pair the notes on the third and second string. When the note on the third string is 1, 3 or 5 of the parent scale, the third above it is major.

So barre at 1, 3, and 5 of the major scale on the third string to include a note at the same fret on the second string.

So, there's a single major third at step "1" of the parent major scale. In A, that's here on the third string, second fret, or here at the fourteenth fret. From parent scale step "1" there are two minor thirds above it and two minor thirds below it. After ascending or descending from "1" through the two minor thirds, two major thirds will follow.

Triad-Based Music

major thirds and major triads in four common modes

[video link](#)

If you're using scale-tone thirds or triads in A major (also called A Ionian) the major thirds and major triads are at 1, 4 and 5. The cycle of thirds is 13572461. You'll need to know this, so you'll hear it a lot from me.

In E Mixolydian, the same major thirds and major triads are 4, b7 and 1 of E.

In B Dorian, the same major thirds and major triads are b7, b3 and 4 of B.

In F# Aeolian, the same major thirds and major triads are b3, b6 and b7 of F#.

This may be confusing. If you work extensively in each mode, it's numbering will become familiar.

why do I need to think in the numbering for each mode?

[video link](#)

It may seem much simpler to think in terms of the parent scale with only seven notes and seven numbers, thinking 2 through 2 for one mode and 5 through 5 for another.

When comparing modes, major scale fingerings, scale-tone triad qualities in order by scale step, thinking in the parent scale is very useful.

If I want to play in A major, I use the scale-tone triads of the A major scale and establish the A chord as the key with emphasis by longer duration, ending a progression with it, using a well-known three-chord progression that ends on, or other means of drawing attention to the A major chord as the key.

If I want to play in E Mixolydian, built on the fifth step of A major, I can use the scale-tone triads of the A major scale and establish the E chord as the key with the various means of emphasis to establish the E major chord as the key.

To play in B Dorian, built on the second step of A major, I can use the scale-tone triads of the A major scale and establish the B minor chord as the key with the various types of emphasis to establish the B minor chord as the key.

To play in F# Aeolian, built on the sixth step of A major, I can use the scale-tone triads of the A major scale and establish the F# minor chord as the key with the various types of emphasis to establish the F# minor chord as the key.

That seems to work well, and it does when you are playing modes of the same parent scale. But, music commonly makes use of multiple parent scales, especially blue-based music like rock and jazz. That's where key scales come in.

key scales versus parent scales

[video link](#)

With key scales, you name every scale after the key. So, if you're in the key of "A", you name every scale with the letter "A". You will commonly use A major, A Mixolydian and A Dorian in a blues-based song. Of course, the scale must have the letter "A" in it to do so. This allows you to compare things with a common tone center.

Thinking in key scale lets you use familiar numberings for scale-tone chords. A IV major chord is always 4-6-1. A II minor chord is always 2-4-6.

The major scale has tones 1 through seven with no altered numbers. A Mixolydian has a flat seven. Dorian has a flat three and a flat seven. In all three of those cases, tones 2, 4, 6 and 1 are not altered, so all three scales have a IV major chord with 4-6-1 and a II minor chord with 2-4-6.

I'll number the tones of this A major scale, speaking the tones louder that are in a IV major chord, 4-6-1. Notice that this D major chord is made with many the 4-6-1 tones I just emphasized. Likewise with A Mixolydian and A Dorian.

Here are each of those three scales with spoken emphasis of 2-4-6, followed by the II minor chord, made with many of the 2-4-6 tones.

[video link](#)

In parent scales, when the key is assigned to a numbered tone other than "1", the chord up a scale step is not "2" and the chord up a fourth is not "4". That's non-intuitive.

If you put the key on "5" and still number it as "5" the chord up a scale step is VI^m. If you put the key on "5" and number it as "1" the chord up a scale step is II minor.

From any note on the sixth string, the note up a perfect fourth is on the same fret of the fifth string. If you put the key on "5" and still number it as "5" the chord up a perfect fourth is I major. If you put the key on "5" and number it as "1" the chord up a perfect fourth is IV major.

Parent scale numbering is useful in keeping track of the chords built on that parent scale, but it doesn't allow you to think of chords that are common to many modes with the same number. For example, a IV major chord, a II minor chord or and VI minor chord occurs with the same numbering in three different modes (major, Mixolydian and Dorian).

With key scales, you can think of a IV major chord made with scale tones 4-6-1 or a II minor chord made with scale tones 2- 4- 6 in either of the three key scales major, Mixolydian or Dorian. I showed this earlier.

You can think of a VI minor chord in major, Lydian or Mixolydian. Here are each of those three scales with emphasis of numbered tones 6, 1 and 3, showing that they all have those tones of a VI minor chord.

Possibly the most important thing about using key scales is the uniformity of numbers in relation to emotive and stylistic qualities of notes. You can count on “3” being a happy note “b3” a sad note, “b5” a depressing note and “#5” an anxious note. “6” suggests swing, “b7” suggests blues and “2” suggests jazz (when its combined with “7” or “b7”).

[video link](#)

the major and minor thirds in each mode

The cycle of thirds is 1-3-5-7-2-4-6-1. You’ll need to know this, so you’ll hear it a lot from me. Thirds include two consecutive numbers from that cycle, like 1 and 3 or 2 and 4.

Each major scale mode has three major thirds. Two of them are on adjacent scale steps, having been “4” and “5” in the parent scale. The remaining “lone” one is at step “1” of the parent major scale.

In major, there are two minor thirds above and below the major third at “1”.

In Mixolydian, the major thirds are at 1, 4 and b7. There are two minor thirds above and below the major third at “4”.

In Dorian, the major thirds are at b3, 4 and b7. There are two minor thirds above and below the major third at “b7”.

In Aeolian, the major thirds are at b3, b6 and b7. There are two minor thirds above and below the major third at “b3”.

[video link](#)

I type chords suggested by major scale-tone thirds for triad-based music

These examples use the A major scale and A chords.

The I major triad is A major and includes 1-3-5. Tracking on the third string, the major third (barreing the third and second strings) at “1” includes 1-3. The third at “3” includes 3-5. 1-3 and 3-5 are both part of the A triad, 1-3-5.

The third at 5 doesn't work for the I major triad, since it would have 5-7, where the "7" is not part of 1-3-5, the I major chord. By changing it to a fourth with 5-1, both tones are in the I major triad 1-3-5. Here is an A major chord of while this fourth (made of tones 5-1) is a part.

So, the I major triad uses the thirds at 1 and 3 and a fourth at 5. Here are those three intervals again, each followed by a chord that includes them.

The I major chord will still be 1-3-5 in any mode that includes a I major chord. Notice that 1-3-5, the notes of this A major I chord are in each of these scales, A major (number and play) and A Mixolydian.

[video link](#)

IV type chords suggested by major scale-tone thirds for triad-based music

These examples use the A major scale and D chords.

The cycle of thirds is 1-3-5-7-2-4-6-1. The IV major triad is D major and includes 4-6-1.

Tracking on the third string, the the interval of a third (fretted on the third and second strings) at scale tone "4" includes 4 -6 and the third at "6" includes 6-1. Both thirds are part of the D triad, 4-6-1.

The third at 1 doesn't work for the IV major triad, since it would have 1-3, where the "3" is not part of 4-6-1, the IV major chord. By changing it to a fourth with key scale 1-4, both tones are in the IV major triad 4-6-1.

So, the IV major triad uses the thirds at 4 and 6 and a fourth at 1.

The IV major chord will still be 4-6-1 in any key scale that includes a IV major chord. Notice that 4-6-1, the notes of a D major IV chord are in each of these scales, A major, A Mixolydian and A Dorian.

In American pop styles, the key Mixolydian or Dorian are used during the IV chord. In blues-based styles, key Dorian is used during the IV chord, so it elaborates to IV7 or IV9.

[video link](#)

V type chords suggested by major scale-tone thirds for triad-based music

These examples use the A major scale and E chords.

The cycle of thirds is 1-3-5-7-2-4-6-1. The V major triad is E major and includes 5-7-2.

Tracking on the third string, the the interval of a third (fretted on the third and second strings) at scale tone "5" includes 5-7 and the third at "7" includes 7-2. Both thirds are part of the E triad, 5-7-2.

The third at 2 doesn't work for the V major triad, it would have 2-4, where the "4" is not part of 5-7-2, the V major chord. By changing it to a fourth with key scale 2-5, both tones are in the V major triad 5-7-2, with chord

So, the V major triad uses the thirds at 5 and 7 and a fourth at 2.

Putting the key on this V chord of the A major scale is called E Mixolydian, which is very common.

The V major chord will still be 5-7-2 in any mode that includes a V major chord. For example, E major is a V major chord in: A major, A Lydian (E major parent scale), A harmonic minor, A Melodic minor or A harmonic major.

[video link](#)

IIIm type chords suggested by major scale-tone thirds for triad-based music

These examples use the A major scale and Bm chords.

The cycle of thirds is 1-3-5-7-2-4-6-1. The II minor triad is B minor and includes 2-4-6.

Tracking on the third string, the the interval of a third (fretted on the third and second strings) at "2" includes 2 -4 and the third at scale tone "4" includes 4-6. Both thirds are part of the Bm triad, 2-4-6.

The third at 6 doesn't work for the II minor triad, it would have 6-1, where the "1" is not part of 2-4-6, the II minor chord. By changing it to a fourth with key scale 6-2, both tones are in the II minor triad 2-4-6.

So, the II minor triad uses the thirds at 2 and 4 and a fourth at 6.

The II minor chord will still be 2 -4-6 in any mode that includes a II minor chord. Notice that 2-4-6 are the notes of an B minor, II minor chord in each of these scales in the key of "A", A major and A Mixolydian.

[video link](#)

VIIm type chords suggested by major scale-tone thirds for triad-based music

These examples use the A major scale and F#m chords.

The cycle of thirds is 1-3-5-7-2-4-6-1. The VI minor triad is F# minor and includes 6-1-3.

Tracking on the third string, the the interval of a third (fretted on the third and second strings) at "6" includes 6-1 and the third at scale tone "1" includes 1-3. Both thirds are part of the F#m triad, 6-1-3.

The third at 3 doesn't work for the VI minor triad, it would have 3-5, where the "5" is not part of 6-1-3, the VI minor chord. By changing it to a fourth with key scale 3-6, both tones are in the VI minor triad 6-1-3.

So, the VI minor triad uses the thirds at 6 and 1 and a fourth at 3.

The VI minor chord will still be 6 -1-3 in any mode that includes a VI minor chord. Notice that 6-1-3 are the notes of an F# minor, VI minor chord in each of these scales in the key of "A", A major, A Mixolydian and A Lydian.

Blues

[video link](#)

V type chords suggested by Mixolydian thirds for blues, swing, and jazz

These examples use E Mixolydian.

In whatever key you need Mixolydian, its tone center has to be on the fifth step of some major scale, then re-numbered with "5" of the major scale as "1" and has to use b7. Flattening seven of an E major scale make it E Mixolydian, the same notes as a "A" major scale from "5" to "5".

An E major chord built on the fifth step of an A major scale can be numbered 5-7-2 in its parent scale "A" major. It would be numbered 1-3-5 in the key of E.

The pattern of thirds built on the A major scale from its fifth step "E" to "E" is the same for E Mixolydian from "1" to "1". They are just numbered differently.

Tracking on the third string, the major thirds (which barre the third and second string happen at Mixolydian scale tones 4, b7 and 1. Two minor thirds occur below "4" and two minor thirds above "4".

The E major chord uses the thirds at "1" and "3" and can use a fourth at "5" (using tones 5 and 1 of E Mixolydian). The V7 type chord, E7, originated on the fifth step of its parent scale, A major scale. E7 is 1-3-5-b7 of E Mixolydian. We can use the third at "5", with E Mixolydian tones 5-b7 (on the third and second string) to represent the significant part of a dominant seventh chord like E7. Dominant seventh chords are common to blues.

At scale tone 6 of E Mixolydian, the third 6-1 suggests the E6 chord (1-3-5-6) common to swing. This includes swing jazz, country swing and rockabilly.

At scale tone b7 of E Mixolydian, the third b7-2 suggests the E9 chord (1-3-5-b7 -2) common to jazz blues.

IV7 type chords type chords suggested by Dorian scale-tone thirds for blues, swing, and jazz

[video link](#)

These examples use E Dorian.

In whatever key you need Dorian, its tone center has to be on the second step of some major scale. A D major scale from “2” to “2” makes an E Dorian scale. Flattening three and seven of an E major scale also makes E Dorian.

A major is 4-6-1 of E Dorian. The thirds built on E Dorian at 4 and 6 and a fourth at 1 are part of the IV major chord, A major.

A7 is 4-6-1-b3 of E Dorian. The third at 1 with 1-b3 is part of the A7. Dominant seventh chords like A7 are common to blues.

A6 is 4-6-1-2 of E Dorian. At E Dorian scale tone 2, the third 2-4 suggests the A6 chord. Sixth chords are common to swing jazz, country swing and rockabilly.

A9 is 4-6-1-b3-5 of E Dorian. At E Dorian scale tone b3, the third b3-5 suggests the A9 chord. Ninth chords are common to jazz blues.

Fingering Thirds

[video link](#)

fingering on strings three and two

Finger 1 is the index finger, 2 the middle finger, 3 the ring finger and 4 is the little finger. With each pair of numbers, the number for the third string is indicated first, then the number for the second string.

2-1 for minor thirds and for sliding major and minor thirds

1-2 for major thirds when sliding the upper note to make a fourth, like 1-3 to 1-4

1-1 or 3-3 for barred major thirds

2-3 for major thirds with neighbors

3-2 for minor thirds with neighbors

3-4 for major thirds, especially double hammer and pull-off. These can be used for double hammer or pull-off from a lower barred major third or from a lower minor third (fingering the lower minor third with 2 on the third string and finger 1 on the second string).

thirds for I, IV and V chords by region on strings three and two

Here are the thirds on the root and third of A major, the I major chord in the key of A, and the interval of a fourth on the fifth of the A chord.

Here are the thirds on the root and third of D major, the IV major chord in the key of A, and the interval of a fourth on the fifth of the D chord.

Here are the thirds on the root and third of E major, the V major chord in the key of A, and the interval of a fourth on the fifth of the E chord.

In the region near the root of the I major chord on the third string, here are the thirds or fourths for I, IV and V chords.

In the region near the third of the I major chord on the third string, here are the thirds or fourths for I, IV and V chords.

In the region near the fifth of the I major chord on the third string, here are the thirds or fourths for I, IV and V chords.

Uses of Thirds

European style

European, Mediterranean, or Mexican melodies harmonized in thirds.

Chuck Berry style

Thirds in Chuck Berry style, usually descending with some slides.

[See Thirds Blues Example 1.](#)

thirds as pickups

In leading into the first beat with a pickup, use thirds. The rhythm can be regular (ie. all eighths or all sixteenths) or irregular (i.e. syncopated).

thirds and fourths with neighboring tones

Be aware of the major scale fingering in the area and finger the thirds with the two middle fingers. Fourths are included because they are substituted for thirds when adding a harmony above the fifth of a chord where you don't want it to be part of a seventh chord. By using a fourth, you are playing the root above the fifth.

The image displays two musical exercises on a treble clef staff with a key signature of two sharps (F# and C#). The first exercise is for a major third, showing two fingerings: 'major third fingering' and 'perfect fourth fingering'. The second exercise is for a minor third, also showing two fingerings: 'minor third fingering' and 'perfect fourth fingering'. Each exercise consists of two measures of music, with fingerings indicated by numbers 1-4 below the notes. Below the staff is a TAB section with four lines, showing fret numbers for each string (1-6) corresponding to the notes in the music.

thirds with bends

[Thirds with single bends](#), [thirds with double bends](#) and double stop bends.

Thirds with chromatics, which is based in ragtime blues and has made its way into blues, country swing and jazz.

Memory Devices for Major Triads and Thirds

Tones with flatted numbers in Mixolydian, Dorian and Aeolian are all roots of major thirds and major triads. The major key blues modes, major, Mixolydian and Dorian all have a IV major.

comparing blues modes

Play I-IV-V of the appropriate qualities in major, Mixolydian and Dorian.

Major is I-IV-V. Mixolydian is I-IV-Vm. Dorian is Im-IV-Vm.

Thirds With Single Bends

[video link](#)

A major scale-tone thirds, bending and releasing the lower tone

The exercise is presented in four systems, each with a treble clef staff and a tablature staff. The key signature is three sharps (F#, C#, G#) and the time signature is 3/4. The tablature staff is labeled 'T A B'.

System 1: Treble staff shows a sequence of eighth notes. Tablature shows fret numbers 15, 16, 15, (15), 14, 14, 14, (14), 12, 14, 14, 14, (14), 12, 14, 14, 14, (14), 12. Bends are indicated by arrows: 'full' from 15 to 16, 'full' from 15 to (15), '1/2' from 14 to 14, '1/2' from 14 to (14), '1/2' from 14 to 14, '1/2' from 14 to (14), '1/2' from 14 to 14, '1/2' from 14 to (14).

System 2: Treble staff continues the sequence. Tablature shows fret numbers 9, 9, 9, (9), 7, 7, 7, (7), 5, 5, 5, (5), 4, 3, 4, 3, (3), 2. Bends are indicated by arrows: '1/2' from 9 to 9, '1/2' from 9 to (9), 'full' from 7 to 7, 'full' from 7 to (7), 'full' from 5 to 5, 'full' from 5 to (5), 'full' from 3 to 4, 'full' from 3 to (3).

System 3: Treble staff continues the sequence. Tablature shows fret numbers 18, 19, 18, (18), 17, 18, 19, 18, (18), 17, 13, 14, 13, (13), 12, 11, 12, 11, (11), 10. Bends are indicated by arrows: '1/2' from 18 to 19, '1/2' from 18 to (18), '1/2' from 18 to 19, '1/2' from 18 to (18), '1/2' from 13 to 14, '1/2' from 13 to (13), '1/2' from 13 to 14, '1/2' from 13 to (13), 'full' from 11 to 12, 'full' from 11 to (11).

System 4: Treble staff continues the sequence. Tablature shows fret numbers 9, 10, 9, (9), 9, 7, 9, 7, (7), 7, 6, 7, 6, (6), 5, 6, 7, 6, (6), 5. Bends are indicated by arrows: 'full' from 9 to 10, 'full' from 9 to (9), 'full' from 7 to 9, 'full' from 7 to (7), '1/2' from 6 to 7, '1/2' from 6 to (6), '1/2' from 6 to 7, '1/2' from 6 to (6).

Thirds with Double Bends

In these examples, “B1” indicates bending a half step (one fret) and “B2” indicates bending a whole step.

upper scale tone	→ 2	3	4	5	6	7	1	2
lower scale tone	→ 7	1	2	3	4	5	6	7
interval	→ m3	M3	m3	m3	M3	M3	m3	m3

T	3	5	6	8	10	12	13	15
A	4	5	7	9	10	12	14	16
B								

When bending both notes the same interval, you should try to lessen the distance between the strings as you bend by 10% or so.
When bending a two fret interval on the third string and a one fret on the second string, usually no compensation is necessary.

second string slur	→		B1		B1		B1	
third string slur	→		B1		B2		B1	
second string finger	→ 1	3		3	3		1	1
third string finger	→ 2	2		2	2		2	2

T	3	4		5	5		6	7
A	4	4		5	5		7	8
B								

second string slur	→		B1		B1		B1	
third string slur	→		B1		B1		B2	
second string finger	→ 1	3		3	3		3	3
third string finger	→ 2	2		2	2		2	2

T	8	9		10	11		12	12
A	9	9		10	11		12	12
B								

second string slur	→		B1		B1		B1	
third string slur	→		B1		B1		B1	
second string finger	→ 1	1		1	3			
third string finger	→ 2	2		2	2			

T		13	14		15		15	16
A		14	15		16		16	
B								

When pre-bending [(B1)] both notes the same interval, you should try to lessen the distance between the strings as you bend by 10% or so. Pre-bending [(B1) or (B2)] a two fret interval on the third string and a one fret on the second string, usually requires no compensation.

second string slur → (B1) R (B1) R (B1) R B1
 third string slur → (B1) R (B1) R (B2) R B1
 second string finger → 3 1 1 1 3 3
 third string finger → 2 2 2 2 2 2

second string slur → (B1) R
 third string slur → (B2) R
 second string finger → 3 1
 third string finger → 2 1

T 5 5
 A 5 5
 B

Sixths with Single Bends

Sixths with Double Bends

Bending sixths is much more limited than bending thirds. When bending simultaneously in sixths, it is not practical to bend the smaller string an interval of a whole step, only a half step. If you can't resist the temptation and just have to bend the smaller string a whole step, finger the smaller string with the index and ring fingers and the larger string with the middle finger. The second and fourth strings are best for bending in sixths, though they can also be performed (with the same fretboard shapes) on the first and third strings.

The image displays musical notation and fretboard diagrams for sixths with double bends. It is organized into three measures, each showing a guitar staff with a treble clef and a corresponding fretboard diagram below it.

- Measure 1:** Shows a second string slur and a fourth string slur. The second string is bent a half step (indicated by 1/2) and the fourth string is bent a whole step (indicated by full). Fingering: second string finger 3, fourth string finger 2. Fretboard diagram shows the second string at fret 12 and the fourth string at fret 12.
- Measure 2:** Shows a second string slur and a fourth string slur. The second string is bent a half step (indicated by 1/2) and the fourth string is bent a half step (indicated by 1/2). Fingering: second string finger 3, fourth string finger 2. Fretboard diagram shows the second string at fret 12 and the fourth string at fret 12.
- Measure 3:** Shows a second string slur and a fourth string slur. The second string is bent a whole step (indicated by full) and the fourth string is bent a whole step (indicated by full). Fingering: second string finger 1&3, fourth string finger 2. Fretboard diagram shows the second string at fret 12 and the fourth string at fret 12.

The fretboard diagrams are labeled T, A, and B on the left side, indicating the strings involved in the bends.

CHORDS IMPLIED BY THIRDS AND SIXTHS

Determine the Chord Type to Figure Out the Key Scale

The key scale is often changed. Especially with thirds and sixths, you need to be aware of which seven-tone scale (commonly a major scale) you are building thirds and sixths on.

See [Modes/Chords and Modes by Numbered Type/Modes by Numbered Type](#).

Every chord that does not use a numbered type matching its scale-tone number in the key changes the key scale. Playing a Dm chord in the key of C doesn't change the key scale, it's still C major because it's still a II type. Playing a Dm chord in the key of C as a VIIm type changes the key scale because it is using Dm on the sixth step of F major. In F major, C is on the fifth step, so the key scale would be C major. The key scale at that point would be C Mixolydian, a "V type" C scale.

Listen for Tonic Chords Intuitively

We can improvise with thirds, sixths or triads without knowing the name of each interval or chord. You don't have to know the name of each chord implied by the interval or chord yaaaou are currently playing. You need to determine aurally ("by ear") if it harmonizes with the current chord and emphasize it if it does by repeating it, sustaining it or otherwise featuring it. If it is not harmonious with the current chord, chances are that a third on the next scale tone up or down *will* harmonize with the current chord. This is due to the fact that the primary construction of chords is every other scale tone.

Determine the Parent Scale

Of all the modes of the major scale, we are most familiar with the Ionian or major scale mode. We know the scale fingerings, chord qualities, chord fingerings, and other harmonies best in terms of the major scale. Similarly, with the other three usable heptatonic scales, we are most familiar with the mode that is closest to the major scale.

Melodic minor is traditionally played differently when ascending and descending. The ascending form is the same as a major scale with a flat three. It is usually used in its ascending form in jazz. The traditional descending version (or form) of the melodic minor scale is the same as Aeolian mode, a major scale with flat three, flat six and flat seven.

We can most easily recall the fingerings and harmonies of the harmonic minor by thinking of it as major sharp five with harmonic minor constructed on its sixth step. Compare the major scale modes below with those of major sharp five, with its descending number series in the ascending order of modes.

modes of the major scale

major	Dorian	Phrygian	Lydian	Mixolydian	Aeolian	Locrian
1-2-3,-4-5-6-7	1-2-b3-4-5-6-b7	1-b2-3-4-5-b6-b7	1-2-3-#4-5-6-7	1-2-3-4-5-6-b7	1-2-b3-4-5-b6-b7	1-b2-b3-4-b5-b6-b7

modes of major sharp five scale

major sharp five	Dorian sharp four	Phrygian major (natural third)	Lydian sharp two	Mixolydian sharp one	Aeolian natural seven (harmonic minor)	Locrian natural six
#5	#4	natural 3	#2	#1	natural seven	#6
1-2-3-4-#5-6-7	1-2-b3-#4-5-6-b7	1-b2-3-4-5-b6-b7	1-#2-3-4-5-6-7	#1-2-3-4-5-6-b7	1-2-b3-4-5-b6-7	1-b2-b3-4-b5-6-b7

modes of melodic minor ascending (major flat three)

major flat three (melodic minor)	Dorian flat two	Phrygian flat one Lydian #5	Lydian flat seven (Lydian dominant)	Mixolydian flat six	Aeolian flat five	Locrian flat four (super Locrian, "flat all")
b3	b2	b1	b7	b6	b5	b4
1-2-b3-4-5-6-7	1-b2-b3-4-5-6-b7	b1-b2-b3-4-5-b6-b7 or 1-2-3-4-#5-6-7	1-2-3-#4-5-6-b7	1-2-3-4-5-b6-b7	1-2-b3-4-b5-b6-b7	1-b2-b3-b4-b5-b6-b7

modes of major flat six (harmonic major)

major flat six	Dorian flat five	Phrygian flat four (super Phrygian)	Lydian flat three (Lydian diminished)	Mixolydian flat two	Aeolian flat one	Locrian double flat seven
b6	b5	b4	b3	b2	b1	bb7
1-2-3-4-5-b6-7	1-2-b3-4-b5-6-b7	1-b2-b3-b4-5-b6-b7	1-2-b3-#4-5-6-7	1-b2-3-4-5-6-b7	b1-2-b3-4-5-b6-b7	1-b2-b3-4-b5-b6-bb7 (6)

"track" the linear parent major scale

Keep your focus on the parent scale by following it up and down a string while playing its harmonies on another string. If you are playing thirds, track the seven tone scale on the larger of two adjacent strings. If you are playing sixths, think of them as inverted thirds and follow the parent scale by "tracking" it on the larger of the two strings. Sixths are usually played on string sets 1-3, 2-4, 3-5 or 4-6.

Double Stops

- **Double Stops Defined**
- **Basic Double Stops**
- **Modal Double Stops**
- **Parallel Thirds and Sixths**
- **Jazz Blues Double Stops**
- **Harmonic Clusters And Tonal Layers**

DOUBLE STOPS DEFINED

double stops are two-note figures that combine either:

[click to play the examples below on video](#)

one note that doesn't change with another that moves up or down one, two or three scale tones

♩ = 100

The example shows a double stop in 4/4 time. The treble clef staff has a half note G4, a quarter note A4, a half note B4, and a quarter note C5. The bass line has fingerings: 8, 10, 8, 8, 10, 8, 9, 10, 9, 8, 10, 9, 7, 9, 8, 9. The first two measures show a stationary G4 with a moving A4, and the next two measures show a stationary B4 with a moving C5.

two notes moving in parallel harmony, usually thirds or fourths

The example shows two notes moving in parallel harmony. The treble clef staff has a half note G4, a quarter note A4, a half note B4, and a quarter note C5. The bass line has fingerings: 5, 6, 5, 6, 7, 8, 8, 10, 8, 7, 10, 9, 7, 5. The first two measures show a stationary G4 with a moving A4, and the next two measures show a stationary B4 with a moving C5. The first two measures are labeled 'thirds' and the next two measures are labeled 'fourths'.

Country/Folk Double Stops

Double stops are common to country piano stylists such as Floyd Cramer and Moon Mullican. Floyd Cramer's double stop style has been called "slip note" style.

Country/folk double stops are extensive in Doc Watson, Chet Atkins, Mark Knopfler, Albert Lee and Brent Mason.

R&B and Soul Double Stops

Double stops are used in R&B. R&B and soul music was one of Hendrix's main resources. They primarily used single upper neighbors and lower neighbors in their double stops. Not much baroque style ornamentation nor country.

Notable R&B and soul artists that used double stops include Cornell Dupree (with King Curtis, Aretha Franklin and The Gadd Gang), Curtis Mayfield, The Impressions, Tower Of Power, Dobie Gray (Drift Away), James Burton (Otis Redding, Aretha Franklin), John Fruciante (Red Hot Chili Peppers), Jack Johnson, Dave Matthews (Jimi Thing).

Hendrix Double Stops

Shuggie Otis and Jimmy James (aka Jimi Hendrix) played the Chitlin Circuit in 1964 and 1965, with the Isley Brothers and Curtis Knight in 1965 before Charles Chandler of the Animals "discovered" Jimmy James in New York and suggested he change his name to Jimi Hendrix (Hendrix was his birth name).

stay in key scale for single note melody

In single note melody, prefer the key minor pentatonic scale throughout whenever you can, like Hendrix's Hey Joe solo. In double stops, play in the key of each chord, with the preferred modes below that play all chords with a flatted seventh (in the key of each root).

folk rock, not country

Hendrix style should distinctly not sound country. There is a subtle distinction between folk rock and country, Folk rock doesn't use pedal steel guitar so much as country. Pedal steel bends sustain a note or two while bending another and tend to

Hendrix's developmental guitar years occurred exactly when folk rock was starting. So, to please his listeners, he incorporated ornamented open position chords and barred versions of them. Use double stops with suspended 2 and suspended 4 to reinforce Hendrix's style (though suspended fourths are used in country). In Hendrix's double stop style, suspended 2 and suspended 4 should be used in folk

rock style. Syncopated rhythm is associated more to Hendrix (and R&B/Blues) than country. Incorporate key minor pentatonic double stops and the key minor with flat five during any of the chords it will work on, to make it more bluesy (Hendrixish) and less country.

folk rock in the low range

Hendrix tended to play more single note hammers and slides on the bass strings. Though Hendrix did not use folk rock double stops in the low range, they seem like a likely extension of his style.

blues with minor chords and minor intervals

Save the first three strings for more bluesy bends and tend to use double stops in the mid and low range. Use minor and diminished chord sounds frequently. They can be [secondary roots](#), such as a minor triad with its root on the third of a major seventh chord. Minor chord sounds can also be darkened versions of existing chords. Usually, avoid emphasizing “6”, because of its association with country swing.

parallel fourths

Use parallel fourths, as Hendrix did in expressing his Cherokee heritage. They sound Asian/American Indian. Have anything to do with the Mongol origin of American Indians?

See the Harmonized Pentatonic Scale.

use dissonance in parts of chords unlike country

Dissonances can appropriately darken the style and keep it from being too sweet. They include these intervals: half steps, whole steps, diminished fifths, and to a lesser extent, minor thirds. Country uses five and six together, so stay away from that whole step.

Descend a scale below a held note, beginning with a scale tone below it (especially where that is a half step), replaying each held note with the corresponding descending scale tone.

baroque ornamentation

Use mordents (grace note movement to a neighbor and back) and trills (like quick “looped” mordents) or sixteenths (or faster rhythms) with regular pulse rhythm (like four sixteenths).

Little Wing style double stops in open position

Hey Joe style double stops, version 2 - [link to video](#)

The musical score is written for guitar (T) and bass (B) in 4/4 time. It consists of two systems of four measures each.

System 1:

- Measure 1 (Chord C):** Guitar has a melodic line with a triplet of eighth notes. Bass has a double stop of 5 and 7.
- Measure 2 (Chord G):** Guitar has a melodic line with a triplet of eighth notes. Bass has a double stop of 5 and 7.
- Measure 3 (Chord D):** Guitar has a melodic line with a triplet of eighth notes. Bass has a double stop of 5 and 7.
- Measure 4 (Chord A):** Guitar has a melodic line with a triplet of eighth notes. Bass has a double stop of 5 and 7.

System 2:

- Measure 5 (Chord E):** Guitar has a melodic line with a triplet of eighth notes. Bass has a double stop of 5 and 7.
- Measure 6:** Guitar has a melodic line with a triplet of eighth notes. Bass has a double stop of 5 and 7.
- Measure 7:** Guitar has a melodic line with a triplet of eighth notes. Bass has a double stop of 5 and 7.
- Measure 8:** Guitar has a melodic line with a triplet of eighth notes. Bass has a double stop of 5 and 7.

Rock Double and Triple Stops

Keith Richards (Brown Sugar, Gimme Shelter, Sympathy for the Devil, Start Me Up) Doobie Brothers (China Grove, Long Train Running), Brian May (We Will Rock You), Davey Johnstone (with Elton John, especially on Saturday Night's Alright for Fighting), Van Halen (Panama, Unchained).

MODAL DOUBLE STOPS

Octave Shapes

Each note by letter name and each note by number re-occurs on the fretboard in a pattern. This pattern can be related to open position chords. Note how the "A" notes on the fretboard occur in shapes related to (and named after) open position chords. For more information see [Octave Shapes](#).

Triad Arcs

Triads are chords made up of three different notes. The notes may be repeated in octaves. Major triads combine the first, third and fifth steps of a major scale. Minor triads combine the first, flatted third (one fret toward the head of the guitar from the third) and fifth of a major scale.

I refer to the three groups of notes that represent all major chord tones or all minor chord tones on the fretboard as *arcs*, since they are the notes conceptually embraced by an arc, as shown below.

major chord tone arcs

minor chord tone arcs

Modes

Each seven tone scale such as the major scale can create, in effect, seven scales. This is done by establishing one or another of the notes as the main note or tone center by reference to that note in the chord progression and melody. See [Modes](#).

Modal Double Stops by Octave Shape

Major and Mixolydian only differ in that Mixolydian has flat seven. Since these major examples do not use scale tone seven (nor b7), they can be used also for Mixolydian.

The image shows a musical score for a guitar exercise titled 'C Major Scale'. It consists of two staves. The top staff is a treble clef staff with a 'C' time signature, indicating common time. The bottom staff is a bass clef staff with a 'T' time signature, indicating treble. The music is written in C major, with notes on the treble staff and fingerings indicated by numbers 1-3. The bass staff contains a sequence of numbers (12, 14, 15, 14, 15, 13, 12, 15, 13, 15, 12, 13, 15, 12, 14, 15, 14, 15) which likely represent fret numbers or a specific fingering system for the left hand. The exercise is divided into four measures, each containing a sequence of notes and fingerings.

JAZZ BLUES DOUBLE STOPS

Jazz piano is a great resource for jazz blues double stops. Great artists to “borrow” from include Cedar Walton, Gene Harris, Keith Jarrett, Oscar Peterson and Vince Guaraldi. Especially Oscar Peterson! George Benson and Pat Metheny are two of many guitarists who have borrowed from these jazz pianists.

Jazz Double Stops on 12 Bar Blues

[illegible]

HARMONIC CLUSTERS AND TONAL LAYERS

Traditionally, double stops are played with single upper and lower neighbors, primarily using common pentatonic scales. By conceiving an area of the fretboard with chord tone subsets of any of four seven-tone scales, many structures can be devised.

In taking this wider view, we will include the following:

- ✦ the major and minor arcs
- ✦ modes of major, harmonic minor and melodic minor scales
- ✦ a pedal point on one string with movement neighboring tones ascending on an adjacent string to the next chord tone (optionally farther on to the fourth if the chord tone is a major third)
- ✦ parallel thirds, fourths and sixths

See [Tonal Layers/Harmonic Clusters](#).

Triads with Neighbor

- **Fingering Triads for Triads with Neighbor**
- **Scale-Tone Triads and Secondary Roots**
- **Modal Triads with Neighbor**
- **Free-Form Triads with Neighbor**
- **Exercises and Sketching**
- **Triad with Neighbor as a Chord Color**
- **Improvising with a Single Triad with Neighbor**
- **Improvising with Multiple Triads with Neighbor**
- **Using Triads with Neighbor to Imply Cadences**
- **Triads with Neighbor with Thirds and Sixths**
- **Triads with Neighbor with Double Stops**

FINGERING TRIADS FOR TRIADS WITH NEIGHBOR

First: Four Triad Types Built in Thirds, Root Position

All of these fingerings should be learned in close voicing, for now. This means the notes involved are as close together in pitch as possible, ascending 1-3-5, 3-5-1 or 5-1-3 and descending 5-3-1, 1-5-3 or 3-1-5, where the 3 may be natural or flatted according to the chord type and “5” maybe flatted, natural or sharp according to the chord type.

First learn to finger the four types of triads built in thirds: major, minor, diminished and augmented. Learn each of them with the root on each of the four string sets, strings 6-5-4, 5-4-3, 4-3-2 and 3-2-1. That makes sixteen triads, all in root position: four types on four string sets.

For each triad, learn three versions: (1) bass note with the little finger, (2) bass note with one of the middle fingers (second finger or ring finger) and (3) with the index finger. That makes forty eight fingerings: four types on four string sets with three categories of fingering. That’s a lot of information, but its in categories and you’ll start to “batch process” it.

Second: Four Triad Types Built in Thirds, All Three Inversions

Next, review fingering for each of the four types of triads built in thirds, close-voiced on strings 6-5-4, 5-4-3, 4-3-2 and 3-2-1 *adding both first and second inversion*. Root position has the root in the bass, first inversion has the third in the bass, second inversion has the fifth in the bass.

Now you have 144 fingerings, but in categories that you batch process. There’s a simple basis with a few categories of variation.

Third: Four Triad Types in Thirds, Three Inversions, 28 Modes

In the next section, you’ll learn the application of all these fingerings to the seven modes of each of four heptatonic (seven tone) scales. It’s a lot of information, so be systematic and learn the most used modes first, Ionian, Dorian, Mixolydian, Aeolian, harmonic minor, Phrygian dominant and Lydian dominant.

SCALE-TONE TRIADS AND SECONDARY ROOTS

Scale-Tone Triads of Four Heptatonic Scales use these in all three inversions

For each of the seven modes of the major scale, the seven modes of melodic minor, the seven modes of harmonic minor and the seven modes of harmonic major (28 modes in all), all 28 triads can be used in each of their three inversions.

Secondary Root Triads

Secondary root chords are alternate versions of chords involving synonyms. Three important categories of secondary chords are built on natural six, three or five in the key of the chord root.

See the chapter "[Substitution](#)"/Shared Thirds: Secondary Roots.

Chord Synonyms

Chord synonyms provide many alternate chord types you can use to build triad with neighbor phrases. Use the tables on the next four pages for synonyms of major scale, harmonic minor, melodic minor and harmonic major.

Secondary Root Triads on the Sixth use these in all three inversions

root on six of a major sixth (natural six only)

Root on the sixth of major sixth chords where the mode includes a natural six produce these modal synonyms:

$$I6 = VI\text{Im}7 \text{ (C6 = Am7)}, IV6 = II\text{Im}7 \text{ (F6 = Dm7)}, V6 = III\text{Im}7 \text{ G6 = Em7)}$$

For I6 (C6), its synonym (Am7) may be abbreviated to VIIm (Am). This makes the synonym I6 no fifth (1-3-6) = VIIm (Am = 6-1-3 of C).

root on six of a minor sixth (natural six only)

Root on the sixth of minor sixth chords where the mode includes a natural six produce these modal synonyms:

$$\text{Im}6 = VI\text{Im}7\text{b}5 \text{ (Cm6 = Am7b5)}, II\text{Im}6 = VII\text{Im}7\text{b}5 \text{ (Dm7 = Bm7b5)}$$

For Im6 (Cm6), its synonym (Am7b5) may be abbreviated to VIIm (Am). This makes the synonym Im6 no fifth (1-b3-6) = VIIm (Adim = 6-1-b3 of C).

root on six of a diminished seventh (minor sixth flat five)

Root on the sixth of minor sixth flat five (diminished seventh) chords where the mode includes a natural six produce the modal synonyms:

$$\text{Im}6\text{b}5 \text{ (Cm6b5)} = I \text{ dim}7 \text{ (Cdim7)} = VI\text{Im}7\text{b}5 \text{ (Am7b5)}, II\text{Im}6 = VII\text{Im}7\text{b}5 \text{ (Dm7 = Bm7b5)}$$

For Im6b5 = Idim7 (Cm7b5=Cdim7), its synonym (Am7b5) may be abbreviated to VI diminished (A diminished). This makes the synonym Im6b5 no fifth (1-b3-6) = A dim (6-1-b3 of C).

in conclusion, the triad synonyms on six are VIIm or VI diminished

$$I6 \text{ no fifth (1-3-6)} = VI\text{Im} \text{ (Am = 6-1-3 of C)},$$

$$\text{Im}6 \text{ no fifth or Im6b5 no fifth (1-b3-6)} = VI\text{dim} \text{ (A diminished = 6-1-b3 of C)}.$$

Secondary Root Triads on the Third

use these in all three inversions

root on three of any type seventh chord

In every case, a scale tone seventh chord without a root is the same as a triad on a root up a third.

Ionian mode triads on the third of a scale-tone seventh chord

Ima7 no root (Cma7 no root) = IIIIm (Em)
 IIm7 no root (Dm7 no root) = IV (F major)
 IIIm7 no root (Em7 no root) = V (G major)
 IVma7 no root (Fma7 no root) = VIIm (Am)
 V7 no root (G7 no root) = VII diminished (B diminished)
 VIIm7 no root (Am7 no root) - I major (C major)
 VIIIm7b5 no root (Bm7b5 no root) - IIm (Dm)

harmonic minor triads on the third of a scale-tone seventh chord

Im(ma7) no root (Cm<ma7> no root) = bIII augmented (Eb augmented)
 IIm7b5 no root (Dm7b5 no root) = IVm (F minor)
 bIIIIma7#5 no root (Ebma7#5 no root) = V major (G major)
 IVm7 no root (Fm7 no root) = bVI major (Ab major)
 V7 no root (G7 no root) = VII diminished (B diminished)
 bVIIma7 no root (Abma7 no root) = I minor (C minor)
 VIIIm7b5 no root (Bm7b5 no root) = II diminished (D diminished)

melodic minor triads on the third of a scale-tone seventh chord

Im(ma7) no root (Cm<ma7> no root) = bIII augmented (Eb augmented)
 IIm7 no root (Dm7 no root) = IV (F major)
 bIIIIma7#5 no root (Ebma7#5 no root) = V (G major)
 IV7 no root (F7 no root) = VI dim (A diminished)
 V7 no root (G7 no root) = VII diminished (B diminished)
 VIIm7b5 no root (Am7b5 no root) = I minor (C minor)
 VIIIm7b5 no root (Bm7b5 no root) = IIm (Dm)

harmonic major triads on the third of a scale-tone seventh chord

Ima7 no root (Cma7 no root) = IIIIm (Em)
 IIm7b5 no root (Dm7b5 no root) = IVm (F minor)
 IIIIm7 no root (Em7 no root) = V (G major)
 IVm(ma7) no root (Fm<ma7> no root) = bVI augmented (Ab augmented)
 V7 no root (G7 no root) = VII diminished (B diminished)
 bVIIma7#5 no root (Abma7#5 no root) - I major (C major)
 VIIIm6b5 no root (Bm6b5 no root) - II diminished (D diminished)

Secondary Root Triads on the Fifth

root on fifth of any type ninth chord

Some ninths have not yet been accepted, such as IIm7b9 and VIIIm7b5b9. So far, ninth chords with a flat nine are only considered acceptable on chords with a natural three. Also, sharp nine is not yet acceptable on a major seventh chord. In every case, an acceptable scale tone ninth chord without a root and without a third is the same as a triad with its a root on the fifth of the ninth chord.

Ionian mode triads on the fifth of a scale-tone ninth chord

Ima9 no root, no third (Cma9 no root, no third) = V (G)
 IIm9 no root, no third (Dm9 no root, no third) = VIm (Am)
 IIIIm7b9 - not yet acceptable
 IVma9 no root, no third (Fma9 no root, no third) = I (C)
 V9 no root, no third (G7 no root, no third) = IIm (Dm)
 VIm9 no root, no third (Am7 no root, no third) - IIIIm (Em)
 VIIIm7b5b9 - not yet acceptable

harmonic minor triads on the fifth of a scale-tone ninth chord

Im(ma9) no root, no third (Cm9<ma7> no root, no third) = V (G)
 IIm7b5b9-not yet acceptable
 bIIIIma9#5 no root, no third (Ebma9#5 no root, no third) = VII dim (B dim)
 IVm9 no root, no third (Fm9 no root, no third) = Im (Cm)
 V7b9 no root, no third (G7b9 no root, no third) = IIdim (Ddim)
 bVIIma7#9 -not yet acceptable
 VIIIm7b5b9-not yet acceptable

melodic minor triads on the fifth of a scale-tone ninth chord

Im(ma9) no root, no third (Cm9<ma7> no root, no third) = V (G)

IIm7b9-not yet acceptable

bIIIma9#5 no root, no third (Ebma9#5 no root, no third) = V (G major)

IV9 no root, no third (F9 no root, no third) = Im (Cm)

V9 no root, no third (G9 no root, no third) = IIm (Dm)

VIm9b5 no root, no third (Am9b5 no root) = bIII augmented (Eb augmented)

VIIIm7b5b9-not yet acceptable

harmonic major triads on the fifth of a scale-tone ninth chord

Ima9 no root, no third (Cma9 no root, no third) = V (G)

IIm9b5 no root, no third (Dm9b5 no root, no third) = bVI augmented (Ab augmented)

IIIIm7b9-not yet acceptable

IVm9(ma7) no root, no third (Fm9<ma7> no root, no third) = I (C)

V7b9 no root, no third (G7b9 no root, no third) = II dim (D dim)

bVIma7#5#9-not yet acceptable

VIIIm7b5b9-not yet acceptable

FREE-FORM TRIADS WITH NEIGHBOR

Three Triad Arpeggio Tones and a Neighbor

Four-note cells, like 1-2-3-5 and 1-3-4-5 are triads with a neighboring scale tone. 1-2-3-5 is a 1-3-5 triad with an upper neighbor “2” as the second note. 1-3-4-5 is 1-3-5 a triad with a neighboring tone “4” as the third note. 1-3-5-6, 1-3-5-4 or 1-3-5-7 would be a triad with a neighboring tone as the fourth note. This opens more possibilities.

Let’s think more broadly. There are four types of triads built in thirds: major, minor, diminished and augmented. The best added tones to create melody make universally familiar chord sounds, are neighbors to chord tones within a minor third or less. Versions of major, minor and diminished chords with one added tone are commonly known and used. Augmented with an added tone is more rare.

Quadrads to Serve As Free-form Triads With Neighbor

free-form versus sequenced triads with neighbor

In Fragment Patterns/[Triad with Neighbor Cells 1-2-3-5 and 1-3-4-5](#), the 1-2-3-5 and 1-3-4-5 triads with neighbor were used in a repeating sequence, which is the nature of fragment patterns. Here, they are used “free-form” where the notes can occur in any order, ascend or descend.

isolated harmonic sounds

The quadrads listed below can be used to present simple, pure chord colors. Sometimes use isolated, defined, pure chord sounds like you might find with simple yet elegant use of ingredients in fine cuisine. At other times, you might want to make dense combination of chord colors analogous to the dense combination of spices you might find in barbecue sauce.

Here, we’re looking at simple, pure chord colors. A triad with a single “spice”. Present each quadrad sound long enough that it defines it for the listener, then follow with other quadrad sounds.

major triads: add 2, 4, #4, 6, b7 or 7

These added tones make major add 9, major add 4, major add #4, major sixth (also called “sixth”), seventh (dominant seventh) and major seventh. In summary, you can choose an added from: 2, two versions of 4, 6 or two versions of 7.

minor triads: add 2, 4, 6, or b7

These added tones make minor add 9, minor add 4, minor sixth and minor seventh.

diminished triads: add 6 or b7

These added tones make diminished seventh and minor seventh flat five (half diminished).

augmented triads: b7

This makes a 7#5 quadrad.

Preferences of 6 or 7 Between Five and One

In [harmonic scalar pulse](#) melody, musical styles have already defined the preferences in choosing to linearly place specific versions of six or seven as a passing tone between scale tones five and one.

In western European folk, bluegrass, country music and other American triad-based music, “6” is preferred between 5 and 1 for major chords.

In western European folk, bluegrass, country music, blues (not swing) and other American triad-based music, “b7” is preferred between 5 and 1 for minor chords.

In swing music, “6” is an option to “b7” between 5 and 1 for minor chords. C major triad with neighbor - major no seven examples

EXERCISES AND SKETCHING

Played as is, these exercises can sound like exercises. To bring them into interesting, free form, creative improvisation, use a mixture of different instances and sketching. With sketching, you would leave notes out or add notes, add decoration like mordents and turns, syncopation and theme and variation.

For each of the instances below, add 7, 2, 4 or 6 in the appropriate version (b7, #4, etc.) to make a triad with neighbor. Be aware of non-chordal tone relationships to the beat: if you are descending 3-1-5 (fifth in the bass), and adding a “4”, putting it on the beat would cause an appoggiatura (leaning tone) tension, so you usually would put the “4” before the beat.

IMPROVISING WITH A SINGLE TRIAD WITH NEIGHBOR

IMPROVISING WITH MULTIPLE TRIADS WITH NEIGHBOR

Triads with Neighbor on a Chord Root and Secondary Root

Two Triads with Neighbor on Multiple Roots and Secondary Roots

Triads Common to Multiple Chords

USING TRIADS WITH NEIGHBOR TO IMPLY CADENCES

Focus On The Roots of the Cadenced Triads on the Fretboard

Learn triad fingerings thoroughly, so you can quickly conceive and play these triads with neighbor. Visualize the sequence of root locations for the three chords involved on the fretboard.

Use a Variety of Triad with Neighbor Cells

Any number may be altered as necessary with a flat or sharp. The 1-2-3-5 triad with neighbor cell is a favorite. Use the others listed below as well. Notice that 1-3-6-5 and 5-3-7-1 have had their last two numbers reversed to end on a triad (1-3-5) tone. “5-6-7-1” and “1-7-6-5” are technically “triad tones 1-5 with passing tones 6-7”.

ascending 7-1-3-5 1-2-3-5 1-3-4-5 1-3-6-5 3-4-5-1 3-5-7-1 5-7-1-3 5-1-2-3 5-6-7-1
 descending 5-3-7-1 5-3-2-1 5-4-3-1 6-5-3-1 1-5-4-3 1-7-5-3 3-1-7-5 3-2-1-5 1-7-6-5

Modal II-V-I Cadences with Roots in Fourths

Cadences are based on the traditional II-V-I cadence (Dm-G-C). Modally, this is three chords in perfect fourths, with the third chord numbered as “I”. Here is a table comparing major scale-tone three-chord cadences with the same cadences numbered modally with the target chord as “I”.

modal table of II-V-I cadences

example in	Dm-G-C	Em-Am-Dm	F-Bdim.-Em	G-C-F	Am-Dm-G	Bdim.-Em-Am	C-F-Bdim.
C major parent scale							
target mode	major	Dorian	Phrygian	Lydian	Mixolydian	Aeolian	Locrian
parent major scale-tone numbers	IIm-V-I	IIIIm-VI-IIm	IV-VIIIdim-I	IIIIm-VI-IIIIm	VIIm-IIm-V	VIIIdim.IIIIm-VIm	I-IV-VIIIdim.
modal scale numbers	IIm-V-I	IIm-Vm-Im	bII-Vdim-I	II-V-I	IIm-Vm-I	IIdim.-Vm-Im	bII-bV-Idim

1-2-3-5 example of a IIm-V-I cadence - [click to play](#)

This example is very predictable and not that interesting. We’ll work on making interesting variations. Since IIm (Dm) and V (G) are generally interchangeable, Dm and G are played during G.

The musical notation shows a sequence of chords: Dm7, G13, Cmaj9, and Fmaj7. Below the staff, the fingerings for the triads are shown: D minor (1 2 b3 5), G major (1 2 3 5), and C major (1 2 3 5). The fretboard diagram below shows the root positions for these chords on the fretboard.

The Flat Five Substitute

In triads, a flat five substitute replaces a V triad (G) with a bII triad (Db). This is called a “flat five substitute” because the interval between V and bII is a flatted fifth.

Roots up in fourths should be associated with roots downward chromatically. The downward chromatic version uses a flat five substitute. Dm-G-C (IIIm-V-I) becomes Dm-Db-C.

1-2-3-5 example of a IIIm-bII-I cadence - [click to play](#)

This is a bit more interesting than the previous example. The example below is the chromatic counterpart of the previous example. The melodic line is a little more pleasing going up on the first four-note cell (Dm) then down on the second cell (Db), then up on the third cell (C). Dm-G-C (IIIm-V-I) becomes Dm-Db-C (IIIm-bII-I). Since IIIm (Dm) and V (G) are generally interchangeable and Db is a flat five substitute for G.

7-3-6-2-5-1-4 Root Sequences to Join Multiple Modal II-V-I Cadences

By adding some [flat five substitutes](#), sequences of four four-note triad with neighbor cells can be used. This allows practice of modal II-V-I cadences to VIIm, I and IIIIm (III diminished in Mixolydian mode) in a continuous sequence. See the examples below. The chord numbers in parenthesis are flat five substitutes for the chords that precede them.

TAB

resolving to VI minor with VI minor, I major and III minor**7-3-6-(b3)-2-#5-1-(b5)-4-7-3 in VI Aeolian - [click to play](#)**

The key is VI Aeolian (E Aeolian). Roman numerals below the music notation staff refer to the parent major (the relative major scale, G major). Note that the V7 chord is changed to #Vdiminished seventh. By using sharp five of the parent major scale, the VI minor scale becomes VI harmonic minor. Note that otherwise, the melody in this example is identical to its I major counterpart, [7-3-6-\(b3\)-2-5-1-\(b5\)-4-7-3 in I major](#).

The musical score is written for guitar in 4/4 time, featuring a treble and bass staff. The key signature has one sharp (F#), indicating E Aeolian. The score is divided into five systems, each with a measure number (1, 3, 5, 7) at the beginning. Above the treble staff, chords are indicated: Em7, Cmaj7, F#m7(b5), and B7(b9). Below the bass staff, Roman numerals are provided for each measure, corresponding to the parent G major scale. The first system (measures 1-2) shows I, VIIIdim, and IIIIm. The second system (measures 3-4) shows VIIm, bIII, IIIm, and #Vdim. The third system (measures 5-6) shows I, bV, IV, and VIIIdim. The fourth system (measures 7-8) shows IIIIm. The score concludes with a double bar line and repeat dots. Fingerings (1-4) are indicated below the bass staff for measures 1, 3, 5, and 7.

resolving to II minor or IV major with II minor, IV major and VI minor

To imply resolution to II minor or IV major, play three four-note triad with neighbor cells (such as 1-2-3-5) with roots ascending in fourths (or descending chromatically with the second chord as a [flat five substitute](#)), designed to end on II minor, IV major and VI minor. The IIm is the “modal relative minor” of IV major and suggests a IV6 chord.

resolving to V major with III minor, V major, VII diminished and II minor

To imply resolution to V major, play three four-note triad with neighbor cells with roots ascending in fourths (or descending chromatically with the second chord as a [flat five substitute](#)), designed to end on III minor, V major, VII diminished or II minor. The III^m is the “modal relative minor” of V major and suggests a V6 chord.

4-7-3-(b7)-6-2-5-(b2)-1-4-7-(4)-3-6-2 in V Mixolydian - [click to play](#)

Implying V-bII-I Cadences Using Triads with Neighbor

Making I-VII dim. or IV-III_m Into a Three-Chord Cadence

Use I-Idim.-VII_{dim.} for I-VII_{dim.} and use II-V_{dim.}-III_m for IV-III_m.

A Wide Variability of Content for the Target I Chord

You don't necessarily need to play a triad with neighbor cell on the target I chord. Begin the I chord with a triad tone or another chord tone followed by one or more additional I chord tones. You could begin the I chord with a triad chord tone then continue with an appropriate pentatonic scale named after the I chord (I major pentatonic for a Ima7 chord, for example) or you could begin the I chord with a large arpeggio, such as a VIIm11 arpeggio for a Ima7 target chord (VIIm11 has the same notes as Ima9/6). See the example below.

I-VIm-IIIm-V with a variety of 1-2-3-5 cell and flat five substitutes - [click to play](#)

1 Am⁷ D⁹ Gmaj⁷ E7(#9)

Cma⁷ Cm⁷ Bm⁷

IV can chromatically voice lead to IIIm⁷ with IVma⁷-IVm⁷-IIIm⁷. IIIm⁷ is Ima⁹nr.

3 Am⁷ D⁹ Gmaj⁷ E7(#9)

Em Am D G Ab Em

To ascend four-note cells in fourths, back-cycle to the target Gmaj⁷ by starting down a fourth for each beat preceding G. Ab is "chromatic drift", with its Eb note on top voice leading to the "E" on the E7#9, thinking Em11 to sound the key of G.

5 Am⁷ D⁹ Gmaj⁷ E7(#9)

G D Am Em

To ascend four-note cells in fourths, back-cycle to the target Em11 (substitute for Gma9) by starting down a fifth for each beat preceding Em. This follow the cycle of fifths: 4-1-5-2-6-3-7-4 etc. or F-C-G-D-A-E-B.

Four Quadrad Arpeggio Tones and a Neighbor

Pentatonic cells, like 1-2-3-5-6 (major pentatonic), 1-b3-4-5-b7 (minor pentatonic) and 1-3-4-5-7 (major seven add four) are quadrads with a neighboring scale tone.

There are about twenty types of quadrads. See “[Chord Archetypes](#)”/Twenty Quadrad Types. Each quadrad is a hybrid of two triads, each triad producing specific mood color.

Free-form Quadrads With Neighbor

With seven tone scales and modes, each quadrad has three options for an added tone. Each added tone has its own character.

Expanding to Octatonic Scales

The chapter “[Relating Chord Tones to the Beat](#)” defines the strategies of adding a half step to a seven-tone scale so a quadrad (seventh or sixth(arpeggio can be ascended or descended with chord tones on the beat and play neighboring or passing tones on the offbeats. This is explored with scales in the chapter “[Bebop and Other Octatonic Scales](#)” and explored with chord progression in the chapter “[Jazz Bass Harmonization](#)”.

QUADRAD HYBRID CHORD COLORS

Build Your Improvising Palette of Colors

the triad defines the primary color

Major is happy, minor sad, diminished is depressed, augmented is tormented, suspended is euphoric or heavenly.

tones added to the triad add shades of color

Two and six are bright shades, six is associated with swing music, flat three and flat seven are bluesy, major seven is romantic. Flat two and flat six are dark and exotic.

GENERAL CHROMATICIZED ARPEGGIO FUNDAMENTALS

Melodic cells that chromaticize arpeggios usually involve three ascending or descending chromatics. They insert chromatics below chord tones, most commonly two chromatics below a chord tone.

Chord Tones on the Beat

You don't always have to have a chord tone on the beat. However, if you are well-practiced at playing melodic cells that *do* place chord tones on the beat, you will find it much easier to play freely and abstractly. Then you won't have to take so much care in putting chord tones on the beat since you have practiced melodic cells that put them on the beat.

Resolved Versus Unresolved Cells

If the last note of a cell is a tone of the current chord, it is "resolved" and is more flexible in rhythmically displacing the melodic cell. If the last note is not a tone of the current chord, it is more important that it is not on the beat, especially at slower melodic rates (notes per minute) where the dissonance would be more apparent. Every-other chromatics are resolved four-note cells where the fourth note is a chord tone. In fragment patterns, 1-2-3-5 and 1-3-4-5 are resolved four-note cells (not chromatic) for the chord "1-3-5".

Avoiding Redundancy in Favor of Movement

It is preferred that the last note of one cell is *not* the same note as the target tone beginning the chord on the next beat. If you see that it would be, change the last note of the four-note cell to a neighboring tone of the target tone, to avoid playing the same note twice in succession. This preserves movement and drive in the melody.

Two Chromatics Below An Arpeggio Tone

Chromatic arpeggio cells feature two chromatics immediately below a chord tone. Rather than practicing every possibility of each type of arpeggio (ma9, min9, etc.), learn to play two chromatic notes below each note in the in-position chromatic scale. Practice the in-position chromatic scale below and be able to:

1. play any tone followed by two chromatic tones immediately below it *with the fingering precisely as written*
2. precede any tone with the two chromatics immediately below it *with the fingering precisely as written*

During the course of playing an arpeggio with chromatics, you will sometimes change position up or down a fret, where the same in-position fingering would be used up or down a fret. Exceptions are often made where an out-of-position note is reached on the head side of the fretboard with the index finger, rather than on the body side with the little finger, especially on the bass strings.

chromatic scale

The chromatic scale exercise is presented in five measures with the following time signatures: 4/4, 3/4, 2/4, 3/4, and 4/4. The notation includes a treble clef and a bass clef. Fingerings are indicated by numbers 1-4 on the treble staff and 7-12 on the bass staff. The exercise shows ascending and descending chromatic patterns with specific fingering instructions.

Play the ascending fingering
in order of ascending pitch.

Play the descending fingering
in order of descending pitch.

THREE-NOTE CHROMATICIZED ARPEGGIO FUNDAMENTALS

Three-Note Chromatic Arpeggio Cells

A melodic cell is a short lick or theme, usually of two to six notes. See the chapter [Melodic Cells](#). More often, melodic cells use chord tones of the current chord on the beat. The melodic cells in the following sections “Three-Note Cells With Ascending Chromatics” and “Three-Note Cells With Descending Chromatics” use chord tones on the beat (shown with a diamond) and chromatics leading either up to (ascending) or down from (descending) each chord tone. The chord tones on the beat could be thought of as *target tones*.

Three-Note Chromatic Arpeggio Cells with Ascending Chromatics

When ascending, arpeggio-chromaticizing melodic cells progress to a target chord tone with two chromatics immediately below the chord tone. In the first two bars below, the notes of a Dm9 arpeggio are shown on the second string. Seeing the notes chromaticized by playing two consecutive frets *before* each chord tone is easier to see on a single string. Next, in bars five through eight, the fingering is shown as it would typically be played, in a single position. Notice in the last two bars that the rhythm may vary, as long as the chord tones remain on the beat.

B 12 13 9 10 12 13 10 11 12 13 10 11 12

in three-note, unresolved melodic cells with ascending chromatics, chord tones beginning the beat don't have to be consecutive

Ascending three-note, unresolved chromatic cells have a chord tone on the beat, followed by two chromatic tones below the chord tone that begins the next beat. With consecutive ascending three-note chromatic cells, the sequence of chord tones on the beat does not have to be consecutive chord tones in ascending or descending order. The two chromatic notes that end each three-note unresolved melodic cell are *two chromatic tones ascending to the chord tone on the next beat*.

It's okay to play the chord tones out of order. Rather than ascending from root to third to fifth, etc. You can whimsically decide the order, such as root to fifth to third to seventh. As you create this whimsical order, insert two ascending chromatics up to each chord tone. In the example below, there are two ascending chromatics before the flatted third of the Dm9 arpeggio (the "F" note, third string, tenth fret) on the second beat, followed by two ascending chromatics to the flatted seventh of the Dm9 arpeggio (the "C" note, second string, thirteenth fret) on the third beat, then to the fifth, then to the ninth.

B 12 13

Three-Note Descending Chromaticized Arpeggio Cells

When descending, arpeggio-chromaticizing melodic cells descend from a target chord tone with two chromatics immediately below the chord tone. They are easiest to hear if they then descend to the next lower chord tone. Of course the rhythm may vary (as in the last two bars below), as long as the chord tones are on the beat, as shown earlier with ascending chromatics. Sequences of them are shown below where chromatics descend from the ninth, seventh, fifth, then the third.

in three-note cells with descending chromatics, its preferred that chord tones on the successive beats are consecutive chord tones

Descending three-note chromatic cells have a chord tone on the beat, followed by two chromatic tones below *that specific chord tone*. descending chromatics follow a chord tone, it is best if you then proceed to the next lower chord tone. Therefore, it is best if you resolve to the next lower chord tone at the beginning of the next beat.

FOUR-NOTE CHROMATICIZED ARPEGGIO FUNDAMENTALS

The most common chromaticized arpeggio cells are four-note cells.

Resolving Chromaticized Arpeggio Cells

resolved and unresolved four-note chromaticized cells

Like all melodic cells, chromatic arpeggio cells are unresolved when the last note is not a chord tone and are resolved when the last note is a chord tone.

resolving to the current chord or to the next chord

Unresolved chromaticized arpeggio cells can resolve to the current chord or to the next chord. If the last two tones of the cell resolve by *ascending* to the next chord, they have to be immediately below the chord tone that begins the next chord, so the last two notes of the cell and their target beginning the next beat form a series of three chromatic tones.

If the last two tones of the cell are descending chromatically from the second note of the cell, they should resolve down a minor third or less to a chord tone of the next chord. This works well when the chord tone of the next chord is a tone common to the next chord, but it doesn't have to be.

resolving to the current chord or to the next chord - [click to play video](#)

The chromatic arpeggio cells below are all in the key of Bb, since melody can be in relation to the key and doesn't have to be in the key of each chord. each cell resolves to a chord tone of the or the next chord, which is only sometimes a Bb chord.

Unresolved Cells

Each of these four-note cells should resolve with the first note on the next beat. They include four types: beginning with two arpeggio tones, the **major third type** and two linear types.

Two Arpeggio Tones, Then Two Chromatics Ascending to a Tone Of the Same Chord

Begin with two arpeggio tones (in any order) then conceive the chord tone you intend to play beginning the next beat. Follow the second arpeggio tone with two chromatics ascending to resolve on the chord tone you have planned on the next beat.

The second arpeggio tone can be the same note as the arpeggio tone (of the same chord) on the next beat. This is the manner of playing minor thirds with **linear chromatics** shown in the next section.

Begin by conceiving three-note chords that are part of the current chord. Think of them graphically. Assign two of the three notes as the first two notes in the four-note chromaticized arpeggio cell. Think of the remaining note as the target tone that begins the next beat. Play the first two notes. Play two chromatics ascending to the third note.

In the C major chord at the right, let's determine that the note on the second string is the first note. That's the fifth of the chord, as indicated with the "5" below the second string. Make the note on the fourth string the second note (the root, labeled "1" below the string). That leaves the note on the third string as the target note on the next beat (the third, labeled "3" below the third string). Precede the third with two chromatic tones, as described below and shown in notation.

Now play the notes of the second string and fourth string, followed by two notes chromatically ascending to the note on the third string, as you see below in the notation and tablature.

two arpeggio tones, then two ascending chromatics on a C chord (C chord tone order 1-5-3)

This is included in the next video example below.

C VIII

Two Arpeggio Tones, Then Two Ascending Chromatics on a C Chord (Six Orders of C Chord Tones)

- [click to play video](#)

Six orders of C chord tones are shown in this example: 1-3-5, 1-5-3, 3-1-5, 3-5-1, 5-1-3 and 5-3-1.

C

5	5 1 3	1 2 1 2 3
6	5 3 1	1 2 1 2 3

Two Arpeggio Tones, Then Two Chromatics Ascending to a Tone Of the Next Chord

As with the previous example, but ascending to a tone of the next chord, begin with two arpeggio tones (they don't have to be consecutive) then conceive the chord tone of a new chord you intend to play beginning the next beat. Follow the second arpeggio tone with two chromatics ascending to resolve on the chord tone you have planned on the next beat.

4	b3	2

Two Arpeggio Tones, Then Two Descending Chromatics to a Tone Of the Same Chord

Begin with chord tone followed by two chromatic descending tones. Resolve to the next lower chord tone. This is a three-note descending chromatic cell. [See Three-Note Descending Chromaticized Arpeggio Cells.](#)

Next, convert the three-note descending cell to a four-note cell by inserting a note before or after the first note. Still it needs to resolve to a fifth note that is the next lower chord tone below the first note. Begin with two arpeggio tones (they don't have to be consecutive), followed by two chromatics descending from the *second* chord tone, then resolve to the next lower chord tone of the same chord on the next beat

Choose three chord tones where two of them are consecutive in pitch (root and third, third and fifth, fifth and seventh, etc.) but not root and seventh. The three steps to constructing these cells are listed below.

In this example, consecutive tones of an A minor arpeggio were chosen in the V position.

1. Play the higher-pitched tone of two consecutive chord tones followed by two consecutive chromatics descending from it.

I chose "b3" as the higher-pitched tone of the tones "1" and "b3", then followed it by two descending chromatics.

2. Next, play the next lower-pitched chord tone. It will be the target. So far, you've built a descending three-note chromaticized cell followed by a target.

Having played "b3" as the higher-pitched tone (of the "1" and "b3" pair of consecutive tones), followed by two descending chromatics, I will then plan on "1" as being the target.

3. Next, convert the three-note descending chromaticized cell to a four-note descending chromaticized cell by inserting a chord tone before or after the first tone. When the chord tone is inserted after the first chord tone, it interrupts the chromatic descent from the first chord tone, which still needs to resolve to the next lower chord tone (below the first chord tone) on the next beat.

Overview: Looking at completed four-note cells constructed in this manner, there are one or two variables. Trading the first two notes is always a variable. If the three tones are consecutive chord tones like root-third-fifth or third-fifth-seventh, the consecutive pair of chord tones could be the first two chord tones or the second and third chord tones.

Scale tones should be used in place of chromatics to descend from the root, making a descent to the fifth (1-7-6-5, 1-b7-b6-5, etc.).

Major Third - Five Consecutive Chromatic Tones Ending On The Target

Without the fifth note, this chromaticized arpeggio cell type is unresolved. It requires a specific target as its fifth note and all five notes are consecutively chromatic, ascending or descending.

Use this option only when the first arpeggio tone in the four-note chromatic arpeggio cell and the target tone (the fifth note) are a major third apart.

Practice the three fingerings for major thirds to prepare. The unique major third fingerings are:

1. spanning five frets inclusively when the two notes are on the same string,
2. the same diagonal shape on each of the pairs of strings 6-5, 5-4, 4-3 or 2-1 (such as fourth string third fret “F” and third string second fret “A”) or
3. the barred notes on the same fret when they are on strings 2 and 3. Play the first chord tone and three chromatic tones to ascend or descend to the chord tone that begins the next beat.

This is the manner of playing major thirds in [linear chromatic sequences](#).

An Ascending Linear Chromatic Arpeggio Cell with an Inserted Fourth Note

This is within a single chord. For the first three notes, play a chord tone followed by two chromatics ascending from immediately below the target tone (the fifth note). For the fourth note, insert a chord tone within a sixth or an upper neighbor scale tone of the fifth note. The fifth note is a target chord tone.

Using the upper neighbor is the basis of ascending [encircling chromatics](#).

A Descending Linear Chromatic Arpeggio Cell with an Inserted Fourth Note

This is within a single chord. For the first three notes, play a chord tone followed by two chromatics descending from it. For the fourth note, insert a chord tone within a sixth or a lower neighbor of the fifth note. Chromatic lower neighbors are preferred. The fifth note is a target chord tone.

Using the lower neighbor is the basis of descending [encircling chromatics](#) (with the preferred lower chromatic neighbor).

Resolved Cells

Both of the following four-note cell types resolve with their last note and don't need to be followed by anything.

Two Consecutive Ascending Arpeggio Tones with Two Chromatics Between

Play ascending consecutive arpeggio tones for the first and fourth notes, such as the third followed by the fifth of an arpeggio. For the second and third notes, play two chromatic tones that ascend to the arpeggio tone on the fourth beat.

Two Consecutive Descending Arpeggio Tones with Two Chromatics Between

Play descending consecutive arpeggio tones for the first and fourth notes, such as the fifth followed by the third of an arpeggio. For the second and third notes, play two chromatic tones that descend immediately below the the arpeggio tone on the first beat.

Review From the Perspective of a Three-Note Chromaticized Arpeggio Cell

Three-note chromaticized arpeggio cells are conceptually simple. You play a tone followed by two chromatic tones descending from it or you play a tone followed by two chromatics that ascend to a chord tone on the next beat.

Three-note chromaticized arpeggio cells can be converted to four-note chromaticized arpeggio cells in either of these three ways:

- ✦ add a chord tone before the first note of the three-note cell
- ✦ add a chord tone as the second note (by adding a note between the first and second notes of the three-note cell)
- ✦ add a note at the end of the three-note cell, making it a resolved four-note cell

Building a Four-Note Cell by Inserting a Note in a Three-Note Cell

inserting a chord tone or neighbor tone

The inserted notes in these chromaticized arpeggio melodic cells will most often be triad chord tones of the current chord. In the case of [encircling chromatics](#), the fourth note in the cell is a neighboring tone. The “inserted” note works best when it is a tone of the triad based on the current chord that is within two triad tones above or below the target chord tone.

conceive and practice three note cells with a space for an inserted note

For each of the insertion types below (before the first note, after the first note, after the second note or after the third note), practice playing a four note cell by inserting a rest as the first, second, third or fourth of four eighth notes or of four sixteenth notes.

inserting a chord tone before the first note of the three-note chromatic cell

Any three-note cell can be elaborated by inserting a triad tone of the current chord before the first note of the cell. This inserted note now begins the beat. Think of these in the following ascending and descending versions:

- ✦ **ascending version:** begin the beat with two chord tones and end it with two ascending chromatic tones to lead up to the chord tone beginning the next beat. Avoid beginning a beat with the same two notes twice consecutively, as you see in beats two and three of the fourth bar below.
- ✦ **descending version:** begin the beat with two chord tones and end it with two chromatic tones descending from the second tone and resolving to the next lower chord tone at the beginning of the next beat.

A																																				
B																																				

inserting a chord tone after the first note of the three-note chromatic cell

Any three-note cell can be elaborated by inserting a triad tone of the current chord after the first note of the cell. The first note of the three-note cell becomes the first note of the four-note cell. This is used for minor thirds in [linear chromatics](#).

inserting a chord tone after the second note of a three-note chromatic cell

These are the odd-sounding ones, which you may or may not like. Inserting a chord tone after the second note of a three-note unresolved chromatic cell inserts a chord tone in between the two chromatic tones that end the three-note cell. In a three-note chromatic cell, the last two tones are chromatics that (1) lead up to a chord tone that begins the next beat or (2) the last two tones are chromatics that descend from the chord tone on the current beat. In either case, the two chromatics can be interrupted with a triad tone of the current chord, within the range of a fifth.

inserting a chord tone after the after the third note of a three-note chromatic cell

Any three-note cell can be elaborated by inserting a tone of the current chord after the last note of the three-note cell. To avoid redundancy and preserve melodic movement, avoid ending one cell and beginning the next with the same note.

An *arpeggio-encircling chromatic cell* can be made by inserting a neighboring tone as the fourth note, making an *W*. With descending encircling chromatics, it is preferred that the lower neighbor tone (the fourth note in the cell) is a *lower chromatic embellishment*. Lower chromatic embellishments are a half step (one fret) below the note they precede.

C⁹

The image shows a musical exercise for the C9 chord. The top staff is in treble clef and the bottom staff is in bass clef. Both staves show a series of chromaticized arpeggios. The notation includes various accidentals and fingerings. The bottom staff has a label 'T A B' on the left side, indicating the notes of the C9 chord: T (C), A (E), and B (Bb).

four-note free form chromatic cells

Four-note free form chromatic cells will include all of these possibilities. Memorizing sequenced instances of the specific categories like linear chromatics, encircling chromatics or every-other chromatics will give you quick access to your memory of the cells, rather than having to construct each cell on the spot. Though it is very efficient to memorize categories of cells (i.e. linear chromatics) in sequences, playing them on each chord tone as you ascend or descend, you don't want you improv to sound like an exercise. Take care to not play more than two of the same type of cell in improvisation, usually. Also, employ interesting melodic rhythm.

LINEAR CHROMATIC SEQUENCES

Three-Note Unresolved Linear Chromatic Cells

Using three note-per-beat melodic rhythms see [Rhythmic Words and Comping/Melodic Rhythms/Three-Note Rhythms](#)), three-note unresolved linear chromatic cells are straightforward. Start with a chord tone on the beat, continue through a three-note rhythm on that beat and resolve to a chord tone on the next beat.

ascending three-note unresolved linear chromatic cells

In ascending, the first tone on the beat should be any chord tone highest chord tone. So on a ninth chord, where an eleventh chord is not acceptable, such as a major ninth, don't ascend from the ninth. Play the chord tone on the beat followed by ascending two chromatic tones immediately below the next higher chord tone, beginning the next beat. See [Three-Note Cells With Ascending Chromatics](#).

descending three-note unresolved linear chromatic cells

In descending, the first tone on the beat should be any chord tone other than the chord root. Play the chord tone on the beat and descend, playing two chromatics immediately below the first tone, followed by the next lower chord tone on the next beat. If the first chord tone is the chord root, descend with another melodic device, such as descending the scale 1-7-6-5 (with any accidentals necessary for the current scale, such as b7 or b6). See [Three-Note Cells with Ascending Chromatics](#) and [Three-Note Cells with Descending Chromatics](#).

Four-Note Unresolved Linear Chromatic Cells

Four-note unresolved cells are usually expected to resolve on the next beat. See [Resolved Versus Unresolved Cells](#). The initial (first) tone of the four-note cell is a current chord tone. The fifth note is a current chord tone that begins the next beat. The fifth note can optionally begin another four-note cell, resolving on the next beat after that.

applied to major and minor thirds

Purely linear chromatics ascend or descend without exception. Major thirds can be ascended or descended chromatically as a four-note cell with a resolution on the next beat. Minor thirds only provide three chromatic notes and a target, so they need an accommodation, most simply by playing the initial chord tone twice.

Major and minor thirds both can use one of the following designs:

1. **Leave a note out.** Conceiving the four-note linear chromatic cell as four eighth notes or four sixteenth notes, leave out the second or third note and replace it with a rest or sustain. For the remaining notes, leave the two chromatics immediately below the higher chord tone. Usually leaving out the second note is better.

If ascending, the remaining notes would be the initial tone, two chromatics ascending from a whole step below the target tone (the fifth note, on the next beat after the four-note cell) and the target tone on the next beat after the four-note cell.

If descending, the remaining notes would be the initial tone, two chromatics descending immediately below it and the target tone on the next beat after the four-note cell.

3. **Insert a nearby chord tone.** Accommodations for four-note linear chromatic cells can be made that are not purely linear. For these accommodations, make an exception to the linear chromatic sequence by playing the initial chord tone, the target chord tone, or any chord tone within a fifth (rarely a larger interval) as either the first, second third or fourth note in the four-note cell. See Chromaticized Arpeggios/ **+s**, which include these linear chromatics with an inserted chord tone, but also with larger intervals to the inserted tone.

“EVERY OTHER” CHROMATIC CELL SEQUENCES

(start with two chromatics below the third and seventh or below the fifth and ninth)

Chromaticizing Every Other Tertian Tone

To make sure chord tones are on the beat, these four-note cells play two chord tones, then two chromatics. Ascending, the two chromatics ascend up to the chord tone on the next beat. Descending, the two chromatics descend from the chord tone at the beginning of the beat (making them the second and third of the four notes in the cell), followed by the next lower chord tone.

Ascending in thirds, chromaticizing every other tone (with two lower chromatic) creates the cycle of chromaticized tones 4-1-5-2-6-3-7 (repeat), which is the cycle of fifths. Descending in thirds, chromaticizing every other tone (with two lower chromatic) creates the cycle of chromaticized tones 7-3-6-2-5-1-4 (repeat), which is the cycle of fourths.

The question is, where do you start and stop to harmonize with the current chord? The answer is, you want the highest chord tone to an acceptable chord tone and the lowest tone to be the root or major sixth (if there is one) of the current chord. Acceptable thirteenthths are II^m13, IV^{ma}13#11 and V13 (though the eleventh should not be emphasized strongly unless you want a suspended sound). The highest acceptable tone of a VI type chord is the eleventh (VI^m11). The highest acceptable tone of a I type chord is the ninth (though the thirteenth can work if the eleventh is de-emphasized). Unless altered, III and VII type chords are only acceptable as sevenths. III can use a flat nine if changed to a III7b9 (with a major third). VII^m11b5b9 is usable as an arpeggio if the b9 is de-emphasized.

Descend from a note that can be an upper chord tone and descend only as far as the root or sixth (if there is a major sixth).

Chromaticizing Every Other Chord Tone Examples

Examples of chromaticizing every other chord tone for C⁷ and C^{m7} chords.

C⁷ and C⁹ Examples:

- C⁷ Arpeggio:** C (root), E[♮] (third), G[♮] (flat seventh), B[♮] (third). Chromaticized: C, E[♮], E[♭], G[♮], G[♭], B[♮], B[♭], C.
- C⁹ Arpeggio:** C (root), E[♮] (fifth), G[♮] (ninth). Chromaticized: C, E[♮], E[♭], G[♮], G[♭], B[♮], B[♭], C.

C^{m7} and C^{m9} Examples:

- C^{m7} Arpeggio:** C (root), E[♭] (flat third), G[♮] (flat seventh), B[♭] (flat third). Chromaticized: C, E[♭], E[♮], G[♮], G[♭], B[♭], B[♮], C.
- C^{m9} Arpeggio:** C (root), E[♭] (fifth), G[♮] (ninth). Chromaticized: C, E[♭], E[♮], G[♮], G[♭], B[♭], B[♮], C.

Each example includes a treble clef staff with the melodic line and a bass staff with the arpeggio sequence (T, A, B) and fingerings (10, 7, 8, 9, 10, 11, 10, 9, 8, 9, 8, 7, 10, 10).

C^{ma9}, C⁹, C^{m9} triad subsets with two chromatics below 3 & 7, 5 & 9

C^{ma9}, C⁹, C^{m9} triad subsets with two chromatics below 3 & 7, 5 & 9

Examples of chromaticizing every other chord tone for C^{ma9}, C⁹, and C^{m9} chords.

C^{ma9} and C⁹ Examples:

- C^{ma9} Arpeggio:** C (root), E[♮] (third), G[♮] (fifth), B[♮] (ninth). Chromaticized: C, E[♮], E[♭], G[♮], G[♭], B[♮], B[♭], C.
- C⁹ Arpeggio:** C (root), E[♮] (fifth), G[♮] (ninth). Chromaticized: C, E[♮], E[♭], G[♮], G[♭], B[♮], B[♭], C.

C^{m9} Example:

- C^{m9} Arpeggio:** C (root), E[♭] (flat third), G[♮] (flat seventh), B[♭] (flat third). Chromaticized: C, E[♭], E[♮], G[♮], G[♭], B[♭], B[♮], C.

Each example includes a treble clef staff with the melodic line and a bass staff with the arpeggio sequence (T, A, B) and fingerings (10, 7, 8, 9, 10, 11, 10, 9, 8, 9, 8, 7, 10, 10).

SKIP CHROMATIC SEQUENCES

Basics of Skip Chromatics

Skips are intervals of a third or larger that “skip” scale tones, rather than ascending or descending stepwise.

woodwind, horn and flute players think chord tones differently

Skip chromatics are inspired by the skips used in funk and jazz saxophone improv. Woodwind players (which include sax players), horn players and flute players don't have a linear graphic layout to play from like fretboard players and keyboard players. They have to think by note name. They think the names of the notes in a chord and whimsically jump from one chord tone to another.

Where fretboard and keyboard players have complicated graphic patterns to play skips, sax players (and other horn players) find it easier for to use skips because they just think a note name and the fingers respond, having memorized the fingering to where it is second nature. They don't have to think the fingering for each note consciously. They have a more intuitive access to chord tones.

Guitar players have to think differently to use skips. *Skip chromatics* is a chromaticizing strategy and employs skips for the guitarist. This strategy would work with lesser ease for keyboard players. Guitarists would find skip chromatics easier, since they use a more repeating sets of fingering patterns for scales and arpeggios, due to the chromatic transposing ability of the guitar, changing key by moving everything up or down so many frets and playing the same pattern.

skip chromatics during a single chord

Skip chromatics are easiest to play and hear during a single chord. Skip chromatics use chord tones of the current chord for skip tones. These are a bit of a stretch melodically, but sound cool. To reinforce the chord, play another chord tone after the resolution, as shown in every third bar below.

It is preferred that skip tones are triad tones, but can also be sixths on chords with a major third (Cma7, Cma9, C7, C9), and flatted sevenths can be used as skip tones on dominant seventh, dominant ninth, minor seventh or minor ninth chords.

Types of Skip Chromatics

descending four-note chromaticized arepeggio cells with the fourth tone as a skip

These cells use a chord tone, two chromatic tones descending immediately below it, a skip to a nearby chord tone as the fourth note, followed by the target tone.

descending four-note chromaticized arepeggio cells with the second tone as a skip

These cells use a chord tone, a skip to a nearby chord tone as the second note, two chromatic tones descending immediately below the first tone, followed by the target tone.

ascending four-note chromaticized arepeggio cells with the fourth tone as a skip

These cells use a chord tone, two chromatic tones ascending from immediately below the target tone (fifth note), a skip to a nearby chord tone as the fourth note, followed by the target chord tone (the fifth note).

ascending four-note chromaticized arpeggio cells with the second tone as a skip

These cells use a chord tone, a skip to a nearby chord tone as the second note, two chromatic tones ascending from immediately below the target tone (fifth note), followed by the target chord tone (the fifth note).

Skip Chromatics on Ninth Arpeggios

In these sequences, each target tone doubles as the first note of the next cell, making a sequence. In the final bar, the first note is the target tone, followed by another chord tone to reinforce the sound of the current chord.

Though the skip tones can be of larger intervals, the skips shown here are the next higher chord tone above the first note or the next higher chord tone below the target chord tone. Notice that for major ninth and ninth chords, (Cma9, C9) chord tone “6” (“A” in the key of C) is used as the fourth note, a skipped chord tone.

descending chromatics with the “skip” interval as fourth note

The musical notation consists of three systems, each with a treble clef staff and a bass staff. The first system (measures 1-6) shows descending chromatic lines for Cm9 and Cmaj9. The second system (measures 7-12) continues the sequence for Cm9 and Cmaj9. The third system (measures 13-18) continues for C9 and Cm9. Fingerings are indicated by numbers 1-4. Chord symbols are placed above the first measure of each system.

ENCIRCLING CHROMATIC SEQUENCES

Four-Note Chromatic Encircling

A *lower chromatic embellishment* is the use of a note a half step below a chord tone to lead up to that tone. They are usually preferred to lower scale tone neighbors of a whole step. *Upper chromatic embellishments* are rarely used. I do use upper chromatic embellishments on diminished sevenths, resourcing the diminished scale.

ascending one chord tone to another

1. Play a chord tone (there must be another chord tone a third above). Call this first note the *initial chord tone*.
2. Play two chromatic tones immediately below the chord tone a third above the initial chord tone, in ascending order. Call the note a third above the initial chord tone the *higher chord tone*. The resolution to the higher chord tone will be delayed (read on).
3. Play the scale tone above the higher chord tone.
4. Play the higher chord tone. Call this the *target tone*.
5. Treating the target tone as another starting point, repeat steps 1-4.

descending one chord tone to another

1. Play a chord tone (there must be another chord tone a third below). Call this first note the *initial chord tone*.
2. Play two chromatic tones immediately below the *initial chord tone*, in descending order.
3. Call the note a third below the *initial chord tone* the *lower chord tone*. The resolution to the *lower chord tone* will be delayed (read on). Play the chromatic tone immediately below the *lower chord tone*. This is a lower chromatic embellishment to the *lower chord tone*.
4. Play the lower chord tone. Now call this lower chord tone the *target tone*.
5. Treating the target tone as another starting point, repeat steps 1-4.

Encircling Thirds

major third minor third

T
A
B

10 7 8 10 9 8 7 9 10

10 11 7 10 8 7 11 9 10

These are four-note cells, intended to resolve on the fifth note. Encircled major thirds ascend 1-2-#2-4 to target 3 and descend 3-b3-2-7 to target 1. “4” is an upper neighbor to 3. “7” is a lower chromatic embellishment.

Encircled minor thirds ascend 1-#1-2-4 to target b3 and descend b3-2-b2-7 to target 1. “4” is an upper neighbor to b3. “7” is a lower chromatic embellishment.

Pickups may precede the first arpeggio tone with a number of notes one fewer than the interval to the arpeggio tone.

encircled third within a triad

These are easiest to conceive in numbers or music notation. These four-note cells can be any of the following:

LOOPEd CHROMATICS

Looped chromatics cycle repeatedly back and forth from one chord tone to another (of the same chord). The basic version cycles between two notes of a chord in an interval of a third, such as root to third, third to fifth, fifth to seventh, etc.

Looped Chromatics on Minor 9 Arpeggios, Four-Note Groups

“Linear connectors” are not part of the repeated loop.

CHROMATICIZING FULL-tertIAN ARPEGGIOS

Most arpeggios are built with every-other scale tone, called thirds. A continuous sequence of every other scale tone is termed *tertian*, Greek for made of thirds. Notice that every-other scale tone of the scale at the left below creates the “full-tertian” sequence at the right.

In each major scale fingering, there are two sets of “every other note”. Beginning on the lowest scale tone (by pitch) and playing every other note, you’ll create the “lowest full-tertian arpeggio”. The notes you skipped constitute the “next lowest full-tertian arpeggio”. All of the scale tone triads, sevenths and larger chords built in thirds are part of these full-tertian arpeggios. You have to sort out which full-tertian arpeggio and the part of it you will use in playing on a particular chord.

Primary Major Scale Fingerings and Full-Tertian Arpeggios

parent major scale by finger number					
parent major scale by scale number					
lowest full tertian					
next-lowest full tertian					

Chromaticizing arpeggios usually involves cells that move from one chord tone to another, commonly following the sequence root, third, fifth, seventh, ninth, eleventh, thirteenth or the reverse order. Chromaticizing cells may, of course, be a smaller version of the thirteenth, such as a ninth chord using root through ninth. They don't usually involve the two chromatics below the root.

CHROMATIC DRIFT

After the swing and bebop eras in the thirties and forties, jazz mellowed and became harmonically simpler with cool jazz, west coast jazz and then modal jazz. With arrangers like Gil Evans (Miles Davis' arranger) and George Russell (author of *The Lydian Chromatic Concept*), arrangements became clearer and uniform, making the melody easier to hear. Chord durations were much longer, giving the improviser more freedom to periodically deviate from the current chord.

A decade later, jazz fusion guitarists John Scofield, Pat Martino, Scott Henderson, Allan Holdsworth and other jazz fusion guitarists expanded what is aurally acceptable to listeners with innovative harmonic, melodic and rhythmic design. They have all used chromatic drift, where bits of pentatonic scales, diatonic scales, arpeggios and melodic themes can reoccur a half step up or down and return. Chromatic drift establishes brief secondary keys. Voice leading is used to return to the original key with chromatic and common tones.

Not everyone likes chromatic drift. They tend to love it or hate it. Look at it as an intense spice and use it sparingly and set it up to make sense. Upon first hearing chromatic drift, it may sound out of key or atonal. Once you realize that the accompaniment has not deviated from the current chord, brief instances of chromatic drift can become acceptable when the listener realizes that the harmonic deviation was intentional and playful.

John Scofield has played in a diversity of styles, including traditional jazz, funk, rock and blues. He's played with Miles Davis, Herbie Hancock, Pat Metheny, Phil Lesh and John Mayer. From all these associations, he picked up ways to play "outside" the key and return while still making sense.

On the score for the "Hip Sway", the chromatic drift example below, there are annotations below the standard notation staff to show superimposed chords and scales that are played. While the main chord is "C7", the melody may play brief melodic cells to represent Cm7 (darkened C7), Bm7, Bbm7 then Cm7 again. Before becoming to questionable harmonically, the tonality returns to the original key. Use a "two second rule": keep your deviation from the current chord shorter than two seconds, so the listener doesn't hear the harmonic disagreement long enough to identify it as too dissonant.

Hip Sway - [click to play video](#)

Hip Sway is in a jazz funk style based on John Scofield, Scott Henderson and Allan Holdsworth.

FREE FORM CHROMATICS

Two chromatic tones can ascend to any chord tone, from immediately below the chord tone and two chromatic tones can descend from the chord tone, immediately below it. The theory of using chromatics in improv is more complex in descending.

Freeform Neighbor Chromatic Cells, Four-Note

Four-note free-neighbor cells are a more intentional version of chromaticized arpeggios, where the first two notes (of four) are always chord tones. The four-note group starts on the beat and is made up of half-beat notes (eighth notes in 4/4, 3/4 or X/4) or quarter-beat notes (sixteenth notes in 4/4, 3/4 or X/4).

Begin on a beat. Play four notes where the first two notes are chord tones within the range of a sixth and the last two tones are linear chromatic scalar upper or lower neighbors to a chord tone on the next beat.

The next beat could be another free neighbor cell or any cell beginning with a chord tone. To avoid odd-sounding chromatics, use two upper scalar neighbors (instead of chromatic) when the upper neighbor to the next target tone is a half step.

The third and fourth notes can be a combination of upper and lower neighbors to the target chord tone on the following beat, making it a type of encircling. In this case, the third note could be a lower chromatic and the fourth note an upper scale neighbor to the target. Or, vice-versa, the third note could be an upper scale tone and the fourth note a lower chromatic to the target. See encircling chromatics below.

When the cell begins on the beat, pickups may precede the first chord tone with a number of notes one fewer than the interval to the chord tone.

Freeform Neighbor Chromatic Cells, Triplet

Triplet free-neighbor cells start with a chord tone on the beat and divide the beat into three equal parts rhythmically, or on the half beat and divide the half beat into three equal parts.

They can be very mentally intensive, so use fingerings that are mechanically and graphically easy for you. They are typically intensive to listen to as well, and should be used sparingly. Avoid playing more than two consecutive triplet free-neighbor cells. This is due to the likelihood that over half the time, you may be playing tones not in the chord and chromatic tones not in the scale a third of the time.

To use a single neighbor, play triplets where the first two notes are chord tones within the range of an octave or less. The third tone is a scalar upper or lower neighbor or a lower chromatic neighbor to a chord tone beginning the next beat (also within an octave of the first two of the four notes). The next beat could be another triplet free neighbor cell or any cell beginning with a chord tone.

Triplet free-neighbor cells ending with two neighbors should be used less frequently, usually not consecutively. Play a chord tone first. The last two tones are linear scalar or chromatic upper or lower neighbors to a chord tone on the next beat. The next beat could be another triplet free neighbor cell or any cell beginning with a chord tone. Like with four-note free-neighbor cells, avoid odd-sounding chromatics by using two upper scalar neighbors (instead of chromatic) when the upper neighbor to the next target tone is a half step.

When the cell begins on the beat, pickups may precede the first chord tone with a number of notes one fewer than the interval to the chord tone.

Use the Principles You Learned from This Chapter

ascend to any chord two with two chromatics below it

descend from any chord tone with two chromatics below it

Be sure to resolve to the next lower chord tone. If you are descending from the root, use heptatonic (major scale or mode) tones instead of chromatics to resolve down to the fifth.

practice sequences, but don't overuse them in improvisation

Practice applying one of the types of arpeggio chromaticizing to each tone as you ascend or descend an arpeggio, but don't use more than two or three consecutive instances of any one type of chromaticized arpeggio or your improv may sound too much like an exercise. An example of a sequence is [Encircling Chromatics by Mode](#).

become expert at segue into and out of chromaticized arpeggio cells

Use melodic content typical of the style you are playing and work to seamlessly integrate chromaticized arpeggio cells into phrases. If, for example, you are integrating chromaticized arpeggio cells into blues rock, incorporate bent notes and blues licks. If you are integrating chromaticized arpeggio cells into funk, incorporate syncopation with consecutive offbeats.

CHROMATICIZING A SCALE TO TARGET ARPEGGIO TONES

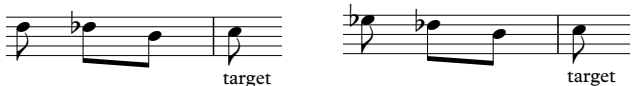

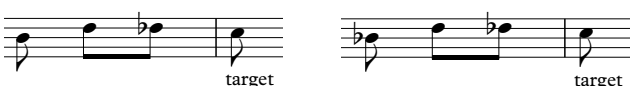

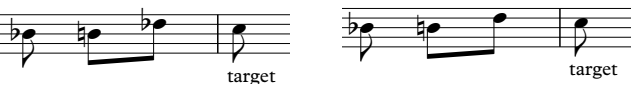

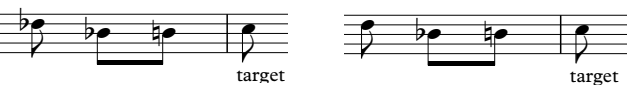

Scalar chromatics place chromatics between and adjacent to scale tones. That is the focus of this chapter.

By contrast, the “[Chromaticized Arpeggios](#)” chapter focused on placing chromatics below chord tones (before a chord tone ascending and after a chord tone descending). Both scalar chromatics and chromaticized arpeggios have the ultimate goal of targeting chord tones.

To get an overview of all the primary types of chromaticizing, see the chapter [Modal II V I Cadences and Turnarounds](#)/Chromaticized Turnarounds/Progressive Chromaticized Cadences. There you will find a list with links to eleven types of chromaticizing.

CATEGORIES OF MELODIC CELLS FOR CHROMATICIZED SCALES ON ARPEGGIOS

Six Primary Cell Categories

<p>2 above, 1 below</p> <p>2 chrom. above, 1 chrom. below m3 above, m2 above, 1 chrom. below*</p> 		<p>1 below, 2 above</p> <p>1 chrom. below, 2 chrom. above whole step below, 2 chrom. above</p> 	
<p>2 below, 1 above</p> <p>2 chrom. below, half step above 2 chrom. below, whole step above</p> 		<p>1 above, 2 below</p> <p>half step above, 2 chrom. below whole step above, 2 chrom. below</p> 	
<p>2 above, 2 below</p> <p>2 chrom. above, 2 chrom. below m3 above, m2 above, 2 chrom. below*</p> 		<p>2 below, 2 above</p> <p>2 chrom. below, 2 chrom. above 2 chrom. below, m3 above, m2 above</p> 	

* The categories that include “two above” may use a minor third and a half step above instead of two chromatic tones when the tone a whole step above the target doesn’t work harmonically. For example, the tone a whole step above the target shouldn’t be a major third on a minor chord nor a major seventh on a chord that has a flatted seventh.

Suggested Order of Study

Start with this pair, applied to each target tone of a dominant ninth chord. In applying it to the fifth, the two chromatics will begin with a flatted fifth, usually an acceptable blue note.

<p>2 above, 1 below</p> <p>2 chrom. above, half step below</p> 	<p>1 below, 2 above</p> <p>half step below, 2 chrom. above</p> 
-----------------------------------------------------------------------------------------------------------------------------------------------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------

Next, apply the same pair (above) to a minor ninth chord. In applying it to the ninth (of the minor ninth arpeggio), use the “minor third above, minor second above, half step below version. The root, flatted third, fifth and flatted seventh can use the designs above, but substitute those below for the ninth.

2 above, 1 below	1 below, 2 above
m3 above, m2 above, half step below	half step below, 2 chrom. above
	

FINGERING CHROMATICIZED SCALES

The fingerings on strings 1-2 below are relatively the same for strings 3-4, 4-5, 5-6 and for single-string versions on string 6. Fingerings that involve both strings 2 and 3 are unique to those strings.

Library of Chromatic Designs

Figure 1 displays 12 musical staves, each showing a chromatic scale starting on a different pitch class (C, D, E, F, G, A, B, C, D, E, F, G). The staves are numbered 1 through 12 on the left. Above each staff, the intervallic structure of the scale is described in text. The scales are:

- Staff 1: C-D-E-F-G-A-B-C (two chromatics above, one chromatic below)
- Staff 2: D-E-F-G-A-B-C-D (one chromatic below, two chromatics above)
- Staff 3: E-F-G-A-B-C-D-E (whole step below, two chromatics above)
- Staff 4: F-G-A-B-C-D-E-F (two chromatics below, half step above)
- Staff 5: G-A-B-C-D-E-F-G (half step above, two chromatics below)
- Staff 6: A-B-C-D-E-F-G-A (two chromatics below, whole step above)
- Staff 7: B-C-D-E-F-G-A-B (whole step above, two chromatics below)
- Staff 8: C-D-E-F-G-A-B-C (two chromatics above, two chromatics below)
- Staff 9: D-E-F-G-A-B-C-D (m3 above, half step above, two chromatics below)
- Staff 10: E-F-G-A-B-C-D-E (two chromatics below, two chromatics above)
- Staff 11: F-G-A-B-C-D-E-F (two chromatics below, m3 above, half step above)
- Staff 12: G-A-B-C-D-E-F-G (two chromatics below, two chromatics above)

Fingerings on Strings 1-2 and on Strings 2-3

two chromatics above, one chromatic below

The musical score consists of two systems, each with a treble and bass staff. The first system covers measures 22 to 26. Measure 22 has a whole rest in the treble and a whole note G2 in the bass. Measure 23 has a quarter rest in the treble and a quarter note G2 in the bass. Measure 24 has a quarter rest in the treble and a quarter note G2 in the bass. Measure 25 has a quarter rest in the treble and a quarter note G2 in the bass. Measure 26 has a quarter rest in the treble and a quarter note G2 in the bass. The second system covers measures 27 to 31. Measure 27 has a whole rest in the treble and a whole note G2 in the bass. Measure 28 has a quarter rest in the treble and a quarter note G2 in the bass. Measure 29 has a quarter rest in the treble and a quarter note G2 in the bass. Measure 30 has a quarter rest in the treble and a quarter note G2 in the bass. Measure 31 has a quarter rest in the treble and a quarter note G2 in the bass.

Measures 49-53. Treble clef, key signature of two flats. Fingerings: 1 4 3 2, 4 3 2 1, 3 2 1 4, 2 1 4 3. Arpeggio patterns: 12 15 14 13, 16 15 14 13, 16 15 14 17, 16 15 18 17.

one chromatic below, minor third above, half step above

Measures 54-57. Treble clef, key signature of two flats. Fingerings: 4 3 1 1, 3 2 1 4, 2 1 4 3. Arpeggio patterns: 12 11 9 8, 12 11 9 13, 12 11 14 13.

Measures 58-62. Treble clef, key signature of two flats. Fingerings: 4 4 2 1, 3 3 1 4, 2 2 4 3, 1 1 3 2. Arpeggio patterns: 16 16 14 13, 16 16 14 17, 16 16 18 17, 16 16 18 17.

whole step below, two chromatics above

Measures 63-74. Treble clef. Key signature: two flats. Fingerings: 1 4 3 2, 1 3 2 1, 3 2 1 1, 3 2 1 4, 2 1 1 4, 2 1 4 4. TAP: 6 10 9 8, 6 10 9 8, 11 10 9 8, 11 10 9 13, 11 10 9 13, 11 10 14 13. AB: 11 15 14 13, 15 15 14 13, 15 15 14 17, 15 15 18 17.

whole step below, minor third above, half step above

Measures 75-83. Treble clef. Key signature: two flats. Fingerings: 4 4 2 1, 3 2 1 1, 2 2 1 4, 1 1 4 3. TAP: 11 11 9 8, 11 11 9 8, 11 11 9 13, 11 11 14 13. AB: 3 4 2 1, 2 3 1 4, 1 2 4 3, 15 16 14 13, 15 16 14 17, 15 16 18 17.

two chromatics below, half step above

Measures 84-94. Treble clef. Key signature: two flats. Fingerings: 1 2 4 3, 1 1 3 2, 4 1 2 1, 3 4 1 1, 2 3 1 4. TAP: 6 7 9 8, 6 7 9 8, 11 7 9 8, 11 12 9 8, 11 12 9 13. AB: 11 12 14 13, 11 12 14 13, 15 16 14 13, 15 16 14 17.

half step above, two chromatics below

Measures 95-99:

Right Hand (RH) Fingerings: 3 1 1 2, 2 4 1 1, 1 3 4 1, 1 2 3 4

Left Hand (LH) Fingerings: 9 6 7, 8, 9 11 7, 8, 9 11 12, 8, 9 11 12, 13

two chromatics below, whole step above

Measures 100-111:

Right Hand (RH) Fingerings: 4 1 2 3, 3 1 1 2, 3 4 1 2, 2 3 4 1, 1 2 3 4

Left Hand (LH) Fingerings: 14 11 12, 13, 14 11 12, 13, 14 15 12, 13, 14 15 16, 13, 14 15 16, 17

whole step above, two chromatics below

Measures 112-127:

Right Hand (RH) Fingerings: 1 2 4 2, 1 1 4 2, 4 1 3 1, 3 4 2 1, 2 3 1 4

Left Hand (LH) Fingerings: 6 7 10, 8, 6 7 10, 8, 11 7 10, 8, 11 12 10, 8, 11 12 10, 13

two chromatics above, two chromatics below

Exercise 128-141: two chromatics above, two chromatics below. The exercise is written for piano with a treble and bass staff. The melody consists of eighth-note runs with chromatic alterations. The bass line provides harmonic support with specific arpeggiated figures.

Measure numbers: 128, 129, 130, 131, 132, 133, 134, 135, 136, 137, 138, 139, 140, 141.

Hand positions (T = Treble, A = Alto, B = Bass):

- Measure 128: T (4 4 1 2 3), A (6 7 10 9), B (8)
- Measure 129: T (4 3 1 1 2), A (6 7 10 9), B (8)
- Measure 130: T (3 2 4 1 1), A (11 7 10 9), B (8)
- Measure 131: T (2 1 3 4 1), A (11 12 10 9), B (8)
- Measure 132: T (1 1 2 3 4), A (11 12 10 9), B (13)
- Measure 133: T (1 4 1 2 3), A (11 12 10 9), B (13)
- Measure 134: T (4 4 1 2 3), A (11 12 15 14), B (13)
- Measure 135: T (4 3 1 1 2), A (11 12 15 14), B (13)
- Measure 136: T (3 2 3 1 1), A (15 12 15 14), B (13)
- Measure 137: T (3 2 3 4 1), A (15 16 15 14), B (13)
- Measure 138: T (2 1 2 3 4), A (15 16 15 14), B (17)
- Measure 139: T (1 4 1 2 3), A (15 16 15 14), B (17)
- Measure 140: T (4 4 1 2 3), A (15 16 15 14), B (17)
- Measure 141: T (4 3 1 1 2), A (15 16 15 14), B (17)

two chromatics below, two chromatics above

Exercise 142-155: two chromatics below, two chromatics above. The exercise continues the melodic and harmonic patterns from the previous section.

Measure numbers: 142, 143, 144, 145, 146, 147, 148, 149, 150, 151, 152, 153, 154, 155.

Hand positions (T = Treble, A = Alto, B = Bass):

- Measure 142: T (1 2 4 4 3), A (6 7 10 9), B (8)
- Measure 143: T (1 1 4 3 2), A (6 7 10 9), B (8)
- Measure 144: T (4 1 3 2 1), A (11 7 10 9), B (8)
- Measure 145: T (3 4 2 1 1), A (11 12 10 9), B (8)
- Measure 146: T (2 3 1 1 4), A (11 12 10 9), B (13)
- Measure 147: T (1 2 1 4 3), A (11 12 10 9), B (13)
- Measure 148: T (1 2 4 4 3), A (11 12 15 14), B (13)
- Measure 149: T (1 1 4 3 2), A (11 12 15 14), B (13)
- Measure 150: T (4 1 4 3 2), A (15 12 15 14), B (13)
- Measure 151: T (3 4 3 2 1), A (15 16 15 14), B (13)
- Measure 152: T (2 3 2 1 4), A (15 16 15 14), B (17)
- Measure 153: T (1 2 1 4 3), A (15 16 15 14), B (17)
- Measure 154: T (1 2 4 4 3), A (15 16 15 14), B (17)
- Measure 155: T (1 1 4 3 2), A (15 16 15 14), B (17)

two chromatics below, m3 above, half step above

Exercise 156-166: two chromatics below, m3 above, half step above. The exercise introduces a major third interval in the upper voice.

Measure numbers: 156, 157, 158, 159, 160, 161, 162, 163, 164, 165, 166.

Hand positions (T = Treble, A = Alto, B = Bass):

- Measure 156: T (4 1 3 2 1), A (11 7 11 9), B (8)
- Measure 157: T (3 4 3 1 1), A (11 12 11 9), B (8)
- Measure 158: T (2 3 2 1 4), A (11 12 11 9), B (13)
- Measure 159: T (1 2 1 4 3), A (11 12 11 9), B (13)
- Measure 160: T (4 1 2 3 2), A (15 12 16 14), B (13)
- Measure 161: T (3 4 4 2 1), A (15 16 16 14), B (13)
- Measure 162: T (2 3 3 1 4), A (15 16 16 14), B (17)
- Measure 163: T (1 2 2 4 3), A (15 16 16 14), B (17)
- Measure 164: T (1 1 1 3 2), A (15 16 16 14), B (17)
- Measure 165: T (4 1 2 3 2), A (15 16 16 14), B (17)
- Measure 166: T (3 4 4 2 1), A (15 16 16 14), B (17)

m3 above, half step above, two chromatics below

System 1 (Measures 167-171):

Treble Clef: 167, 168, 169, 170, 171

Bass Clef: 11, 9, 11, 7, 8, 11, 9, 11, 12, 8, 11, 9, 11, 12, 13, 11, 14, 11, 12, 13

System 2 (Measures 172-176):

Treble Clef: 172, 173, 174, 175, 176

Bass Clef: 16, 14, 15, 16, 13, 16, 14, 15, 16, 17, 16, 18, 15, 16, 17, 16, 18, 15, 16, 17

MELODIC EXAMPLES OF SCALAR-CHROMATICIZED ARPEGGIOS

Chromatic Enclosure Blues - [click to play](#)

The musical score consists of six systems, each with a treble and bass staff. The notation includes notes, rests, and fingerings (numbers 1-5). Labels such as "chrom. scale" and "chrom. arpeggio" are placed below the staffs to indicate the type of melodic movement. Chord symbols are placed above the staffs to indicate the harmonic context. The key signature is B-flat major (two flats).

System 1: Treble staff starts with a whole rest, followed by a chromatic scale (Bb, B, C, D, Eb, E, F, G, Ab, A, Bb, B). Bass staff has fingerings 6, 9, 7, 8, 6, 5, 8, 6, 7, 6, 8, 6, 6, 6, 9, 7, 8, 6, 7, 6, 8, 9, 8, 7, 6, 5, 9, 7. Labels: chrom. scale, chrom. scale, chrom. arpeggio, chrom. sc.

System 2: Treble staff has chords Eb7, Eo7, Bb13, G7. Bass staff has fingerings 8, 8, 5, 9, 7, 8, 9, 8, 7, 9, 6, 6, 10, 9, 7, 8, 8, 10, 9, 7. Labels: chrom. scale, chrom. arpeggio, chrom. scale, chrom. scale.

System 3: Treble staff has chords Cm7, F9, Bb13, G7, Cm7, F9. Bass staff has fingerings 8, 8, 5, 9, 7, 8, 8, 6, 7, 9, 8, 6, 7, 10, 9, 7, 8, 8, 9, 8, 8, 8, 8. Labels: chrom. scale, chrom. arpeggio, chrom. scale.

System 4: Treble staff has chords Bb7, Eb9, Bb7. Bass staff has fingerings 6, 10, 6, 9, 8, 7, 9, 6, 6, 6, 8, 5, 6, 8, 7, 7, 8, 9, 8, 7, 8, 7, 6, 8, 7, 9. Labels: chrom. scale, chrom. arpeggio, chrom. arpeggio, chrom. scale.

System 5: Treble staff has chords Eb9, Eo7, Bb7, G7(b9). Bass staff has fingerings 6, 9, 6, 8, 8, 7, 9, 6, 8, 8, 7, 9, 6, 10, 6, 9, 8, 7, 9, 6, 7, 9, 9, 6, 8, 7, 9. Labels: chrom. scale, chrom. scale, chrom. scale, chrom. scale.

System 6: Treble staff has chords Cm11, F9, Bb9, G7, Bb13, F9, A9 Bb9. Bass staff has fingerings 6, 7, 8, 5, 8, 7, 9, 6, 8, 6, 9, 8, 6, 7, 8, 7, 5, 9, 8, 8, 5, 8, 7, 9, 6, 5, 6, 5, 6, 5. Labels: chrom. scale, chrom. arpeggio, chrom. scale.

Autumn Leaves - Scalar Chromatics - [click to play](#)

Swing Eighthths

♩ = 160

two (or three) above, one below

First system of musical notation for 'Autumn Leaves'. It features a treble clef and a key signature of two flats (Bb and Eb). The tempo is marked 'Swing Eighthths' with a quarter note equal to 160 beats. The time signature is 4/4. The notation includes a series of eighth notes with fingerings (1-4, 3-2, 4-2, 4-2, 2-4, 3-2, 1-4, 2-2, 4-1, 2-4, 2-2, 1-4, 2-1, 4-2, 1-4) and a corresponding bass line with fingerings (7-10-9, 8-10-8-10-8, 10-9-8-6-7, 8-8-10, 6-10-8, 7-10-7, 8-10-8, 8-7, 6-10-8, 7-10, 9-7, 11). Chord symbols above the staff include Cm7, F9, Bbmaj7, and Ebmaj9.

Second system of musical notation for 'Autumn Leaves'. It continues the melodic line with fingerings (3-3, 1-3, 1-3, 1-4, 3-1, 2-1, 4-2, 1-4, 3-2, 1-4, 2-1, 1-4, 3-2, 1-3, 4-3) and a bass line with fingerings (10-10-8-10-8, 10-7, 11-10-8, 9-7, 10-8, 7-10-9, 8-6, 10-8, 7-7, 10-9, 8-7, 10-11, 10). Chord symbols above the staff include Am7(b5), D7(b9), and Gm7.

two (or three) below, one above

Third system of musical notation for 'Autumn Leaves'. It features a treble clef and a key signature of two flats. The notation includes a series of eighth notes with fingerings (1-3, 1-1, 3-3, 1-3, 1-1, 2-3, 1-4, 3-4, 2-1, 3-1, 3-1, 1-3, 1-2, 2-4, 2-1, 4-2, 1-1, 4-1) and a bass line with fingerings (8-10-8, 8-10-10-8, 10-8, 7-8, 9-7, 10-9, 10-8, 7-10, 8-10-8, 8-10-7, 8-8, 10-8, 7-10, 8, 6-7, 10). Chord symbols above the staff include Cm7, F9, Bbmaj7, and Ebmaj9.

Fourth system of musical notation for 'Autumn Leaves'. It features a treble clef and a key signature of two flats. The notation includes a series of eighth notes with fingerings (2-3, 1-3, 1-1, 3-2, 1-1, 1-4, 2-2, 2-3, 1-4, 3-4, 3-1, 3-4, 1-1, 2-4, 2-1) and a bass line with fingerings (8-10-8-10-8, 10-9-8-6-7, 10-8, 9-10, 8-11, 10-11, 10-8, 10-11, 8-7, 10-8). Chord symbols above the staff include Am7(b5), D7(b9), and Gm7. The system ends with a double bar line.

- **Half-Whole-Half Cell Library**
- **Half-Whole-Half Examples**

HALF-WHOLE HALF MELODIC CELLS DEFINED

The term “half-whole-half” implies a common melodic cell, very prevalent in jazz, especially Bebop. It adds color to the melody and should be used freely to express diminished seventh sounds, without necessarily associating it with any particular scale. Each instance has options of scales to associate it with. So, it can stand alone, or be elaborated with a scale.

When the half-whole-half sequence is played twice or more consecutively ascending or descending it alternates half and whole steps and ends with a half step. If the half-whole interval sequence is continued in ascending or descending an octave, it creates the diminished scale. The half-whole-half interval sequence can occur linearly through one, two, three or four consecutive minor thirds. If it continues through four consecutive minor thirds, it constitutes the diminished scale.

Decorate Minor Thirds

Half-whole-half sequences decorate the minor third part of chords. They can decorate a single minor third. When they decorate two or more consecutive minor thirds they make diminished sounds. A single minor third occurs within most chords. Two consecutive minor thirds occur in a diminished triad and from the third to flatted seventh of a dominant seventh chord, among many other chords. Three consecutive minor thirds constitute a diminished seventh arpeggio which can form a continuous cycle of minor thirds limited only by the range of your instrument and the range of our hearing.

Phrase With the Chord Tones on the Beat

Phrase the half-whole-half sequences so the tones of the chord you are decorating are on the beat, or push the beat by playing the tone you are decorating immediately before the beat, then don't play on the beat. The lower chromatic and upper chromatic embellishments you read about below should generally be on the metrically de-emphasized part of the beat, like the last half or third of the beat or the second quarter of the beat.

Three Things to Work on with Half-Whole-Half

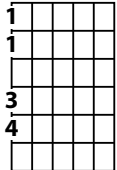

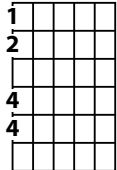

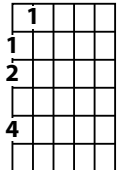

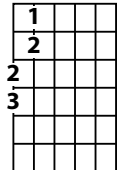

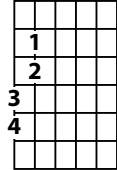

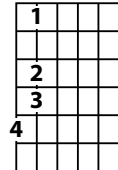

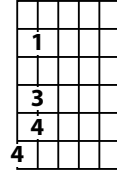

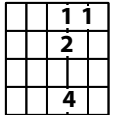

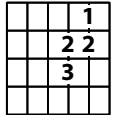

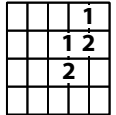

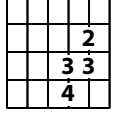

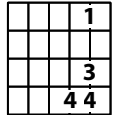

- which chords to use the half whole half on
- simple numeric memory devices to apply them
- memorize [diminished seventh arpeggios and diminished scale](#)

In regard to the chords to use half-whole-half, it can be applied to harmonic minor-type V chords, melodic minor -type V chords (super Locrian) and diminished seventh chords.

For numeric memory devices, think “b6” of target for harmonic minor type V of target, “5” of target for melodic minor-type V chords. For diminished seventh chords, use the half-whole-half sequence has the higher pitched of each half step on diminished seventh chord tones.

FINGERING HALF-WHOLE-HALF

It is essential that you memorize all these fingerings to use half-whole-half cells in your improv. The first fingering can be used on any string, including the third. Those shown on strings six and five could be used on any adjacent pair of strings except 3-2 (on 6-5, 5-4, 4-3 or 2-1). Due to the change of tuning between the third and second strings (a major third instead of a perfect fourth), fingerings on 3-2 are unique.

any string	any string	not on 32	not on 32	not on 32	not on 32	not on 32
						
		only on 32	only on 32	only on 32	only on 32	only on 32
						

Key Scale Versus Chord Scale Half-Whole-Half Cell Numbering

Key scale numbers relate to a major scale named after the tone center for the key. Chord scale numbers relate to a major scale named after the root of the chord.

Thinking the numbers for half-whole-half cells in terms of key scale numbers promotes the continuity of the overall key of the melody, rather than fragmenting the melody into a key for each chord. At the same time, it helps to build melody graphically and numerically on a chord by thinking in chord scale numbers. If a chord has a duration long enough to warrant a temporary key, then it makes sense to think numbers in relation to it, where it then becomes a "I" chord of the temporary key.

COMMONLY-USED HALF-WHOLE-HALF CELLS

Unless noted otherwise, half-whole-half cells are numbered here in terms of the key (I chord). 7-b7-b6-5 is descending (“down”), since it has descending numbers. Its ascending (“up”) version is in reverse order: 5-b6-b7-7. The fourth tone of each half-whole-half sequence should be a current chord tone or a tone of the chord you are superimposing (such as a V of the current chord).

Note that the key b3-2-1-7 and 7-b7-b6-5 half-whole-half cells can be used on I, V or bII. There are special considerations for using them on Ima7 and Im, as you can see in the “use on I” column of the table. The commonality of the b3-2-1-7 and 7-b7-b6-5 half-whole-half cells can make them ambiguous in regard to which chord they apply to and there for contributes to them being somewhat “stand-alone” melodic cells that we can relate to without necessarily assigning them aurally to a particular chord.

key tones	resolve to the I chord	resolve to the V chord
b3-2-1-7	resolve the “7” to “1”	sustain “7” into the V chord (its third)
7-1-2-b3	sustain “b3” into the I minor chord (its flat third)	sustain “b3” into the V7 augmented chord (its sharp five)
7-b7-b6-5	sustain “5” into the I chord or resolve it up to the root of the I chord	sustain “5” into the V chord (its root)
5-b6-b7-7	sustain the last note into the I minor chord	sustain “7” into the V7 chord (its third)
b5-4-b3-2	sustain “2” into the Im9 chord (its ninth) or resolve to the “b3” of the I chord	sustain “2” into the V chord (its third)

Temporary Keys

relative minor

Think of VIm as a key (I) in the key of VIm (VIm becomes Im).

secondary dominants

See [Secondary Dominant](#).

Think of III7 as V of VIm in the key of VIm (VIm becomes Im and III7 becomes its V7).

Think of VI7 as V of IIm in the key of IIm (IIm becomes Im and VI7 becomes its V7).

Think of II7 as V of V in the key of V (V becomes I and II7 becomes its V7).

USING PHRYGIAN DOMINANT TO SOUND DIMINISHED SEVENTH

Half-whole-half occurs with tones 7-1-2-b3 in the harmonic minor scale (also in melodic minor). In terms of the same scale named after the root of the V chord, Phrygian major, it is tones 3-4-5-b6. This sequence of four notes is very important in jazz and in the north African and middle-eastern music from which it came.

diminished seventh as part of the V chord in minor keys

V7b9 is a typical chord in minor keys. V7b9 without a root is VII diminished seventh. The VII diminished seventh can be elaborated with I harmonic minor. Naming the I harmonic minor scale tones in terms of the temporary key of the V chord is the Phrygian major (also called Phrygian dominant) mode (scale or mode are interchangeable here: it could be called Phrygian major mode, Phrygian major scale, Phrygian dominant mode or Phrygian dominant scale).

The most common application of half-whole-half is in minor keys, during the V chord. See [Harmonic Application of Half-Whole-Half](#). In terms of key scale, the half-whole-half interval sequence can ascend from #1-3,5-b7 (the tones of #I°7) or from 2-4-b6-7 (the tones of II°7). Half-whole-half melodic cells are most effective when related to the V chord of I, II, IV or VI harmonic minor (or major flat six). The respective key scale names for each of those are V Phrygian major (V of I harmonic minor), VI Phrygian major (V of II harmonic minor), I Phrygian major (V of IV harmonic minor) and III Phrygian major (V of VI harmonic minor).

USING DIMINISHED SCALE TO SOUND DIMINISHED SEVENTH OR 13b9#9#11

Use diminished scale as a resource for more often fingering short passages of half and whole step sequences, not so much as a scale you would play over a large range.

Fingering Diminished Arpeggios and the Diminished Scale

the numbers on the diagrams below are finger numbers
for diminished scale, the target diminished seventh is black when ascending, grey when descending

diminished seventh arpeggio

diminished scale

Diminished Scale

The diminished scale is commonly referred to with two names: “whole/half diminished scale” and “half/whole diminished scale”, each referring to the two repeating intervals that *ascend* from its tone center. Diminished whole-half scale sounds one diminished seventh chord, which has four synonyms. Diminished half-whole scale sounds either of four altered thirteenth chords, 13b9#9#11 chords.

Linearly Emulating Diminished Seventh

More often, diminished scale is used to emulate a diminished seventh chord or the *diminished seventh part* of a 7b9 chord. Bb diminished seventh can be used when the accompaniment chord is Bb dim7 or when the accompaniment chord is A7b9, which includes all the tones of a Bb dim7 chord. A7b9 no root = Bbdim7. A7b9 contains A-C#-E-Bb-G and Bbdim7 contains Bb-C#-E-G (C# is the same note as Db).

Start applying diminished scale by sounding diminished seventh chords (the black tones on the diagrams above) or 7b9 no root chords (also the black tones above). Be clear that the root of 7b9 is a gray note on the diagrams above and the remaining third, fifth, flatted seventh and flatted ninth of the 7b9 chord are black tones, which by themselves make a diminished seventh chord.

Using Diminished Scale To Sound Diminished Seventh

Diminished scale, black tones on the beat, making a diminished seventh sound on the black tones.

Swing Eighths

♩ = 120

The musical score is written for piano in 4/4 time, Swing Eighths, with a tempo of 120. It features a melody line and a bass line. The melody line starts with a whole note A^{dim}7 chord, followed by a series of eighth notes. The bass line follows a similar pattern. The score includes fingerings for both hands.

Using Diminished Scale To Sound 13b9#9#11 and 7b9 no root

Diminished half-whole scale is either of the three fingerings below with the key on one of the gray tones. Each gray tone repeats in octaves and each octave set of gray tones can be a root of a different 13b9#9#11 chord. The 7b9 no root part of each 13b9#9#11 chord (with a gray root) is a diminished seventh made of the black tones (bII dim7 = III dim7 = V dim7 = b7 dim7).

Playing the scale linearly up and down works better to sound 7b9 no root chords. 7b9 no root is part of 13b9#9#11. Playing the scale in a non-linear, melodic manner (i.e. with skips and irregular rhythm) works better to sound 13b9#9#11 chords.

gray 13b9#9#11 roots, black bII°7 = III°7 = V°7 = bVII°7 roots

An Oddity: Diminished Half-Whole Scale To Sound Diminished Seventh with “Upper Chromatic Embellishments”

In late nineteenth century eastern European classical music and in ragtime and marching band music that followed, it was established that a chord tone could be preceded by a tone a half step below. This has been called a *lower chromatic embellishment*. Since this was *not* also done in approaching from a half step above, there is no generally accepted use of an *upper chromatic embellishment*. But, there could be. We can make new rules to expand composition and arranging.

PERFECT FOURTHS MOVING IN MINOR THIRDS

fingering diminished scale in perfect fourths, moving in minor thirds

The diagrams below show fingering in a single strict vertical position. See [Playing in Position/Strict Vertical Position](#). On the diagrams below, the *second* fret from the top of each diagram is the numbered position. In any case, keep the top fret on all the diagrams below on the *same* fret.

fingering 1

numbered after the finger of the lowest note on the sixth string

fingering 2

numbered after the finger of the lowest note on the sixth string

fingering 3

numbered after the finger of the lowest in-position note on the sixth string—"extended range" is not "in-position"

In the fingerings below, play the notes in perfect four pairs, as shown in the tablature below. Be sure to use the finger numbers as on the diagrams and as shown in the white space above the tablature.

Pairs Of Fourths Using the Eight Notes of One Diminished Scale

When you use lower chromatic embellishments to each of the four tones of a target diminished seventh in ascending *and* upper chromatic embellishments to each of the four tones of the same target diminished seventh in descending, *you will use all twelve chromatic tones*: four unique tones in the target diminished seventh arpeggio, four lower chromatics for them and four upper chromatics for them.

With perfect four pairs of notes moving in minor thirds, *you will use only the eight notes of the diminished scale.* The lower tone of each perfect fourth and the upper tone of each chromatic pair are in the same diminished seventh arpeggio part of the diminished scale. Conversely, the upper tone of each perfect fourth and the lower tone of each chromatic pair are in the same diminished seventh arpeggio part of the diminished scale.

Usually, the upper tones of the perfect fourth parts are the emphasized diminished seventh chord tones. With [the 13#11b9#9 exception](#), the *lower tones* are the emphasized diminished seventh chord tones. By *not* using all twelve chromatic tones as you would do with upper and lower chromatic embellishments to a diminished seventh chord (see [ascending and descending uses all twelve chromatic tones](#)), the target diminished seventh chord sound is preserved.

The target diminished seventh chord sound is would be muddled if pairs of fourths (moving in minor thirds) were used with the target tones as the *upper* tones of each perfect fourth pair and as the *lower* tones in descending, using all twelve chromatic tones. The chromatic embellishments make it more clear what the target diminished seventh chord is, since the chromatic embellishment tones are de-emphasized and create a strong tension and release with their half step resolution to each diminished seventh chord tone.

Prefer to Place Target Diminished Seventh Tones As the Upper Tones of Pairs of Fourth

There is a historical preference to emphasize the upper tone of each perfect fourth as established in using scale tone five to precede scale tone one above it. For this reason, I generally put the tones of the diminished seventh chord I want to emphasize as the collection of *upper* tones of the perfect fourth pairs.

Emphasize the chord tones by phrasing so the upper-pitched tone of each perfect fourth pair is on the beat. In descending, this means the first tone of each pair (the upper tone) is on the beat. In ascending, the lower-pitched tone of each perfect fourth would be on the beat. So, ascend with the first (upper) tone of each pair on the beat and descend with the second (upper) tone of each pair on the beat.

The diminished seventh chord you are emphasizing could be either the V7b9 no root (VII dim7) or the Goodman/Christian Im6b5 (Idim7).

Using Perfect Fourth Pairs with the 13#11b9#9 Exception

An exception to the historical preference to emphasize the upper tone of each perfect fourth can come into play in where you are using the diminished scale to establish a 13b9 chord sound. This works especially well on 13b9 with b2 in the bass (C13b9/Db bass). See [applying diminished scale to 13b9 chords](#).

With the treatment described here for the 13#11b9#9, you are only using the eight notes of the diminished scale, since you play the same notes in ascending and descending.

Thinking in the key of the chord, sound the C7b9 no root part of C13b9#9#11, which is Db diminished seventh, use pairs of perfect fourths tones moving in minor thirds, with the *lower* tones of the perfect fourths would as the Dbdim7 part of the C13b9#9#11.

This is an opposite manner to how you would use fourths with a VIIIdim7 (Bdim7) part of a V7b9 (G7b9) chord, you would put the second note on the beat in descending and the first note on the beat in ascending.

DIMINISHED FIFTHS MOVING IN MINOR THIRDS

Diminished Seventh as Diminished Fifths Moving in Minor Thirds

The diagrams below show fingering in a single strict vertical position. See [Playing in Position/Strict Vertical Position](#). Keep the top fret on all the diagrams below on the *same* fret.

The image displays a musical score for guitar, consisting of a treble clef staff and a bass clef staff. The treble staff contains a melodic line with a key signature of one sharp (F#) and a time signature of 4/4. The melody is composed of eighth and quarter notes, with a final measure containing a half note and a quarter note. The bass staff contains a bass line with a key signature of one sharp (F#) and a time signature of 4/4. The bass line is composed of eighth and quarter notes, with a final measure containing a half note and a quarter note. Fingerings are indicated by numbers 1-4 for the right hand and 1-8 for the left hand. The score is divided into four measures by vertical bar lines.

Diminished Fifths Moving in Minor Thirds with Lower Chromatics

Keep the higher-pitched tone of each chromatic pair on the beat. Use the lower-pitched tone of each chromatic pair (1) as a pickup, or (2) as a “trailing lower chromatic”, where the higher-pitched tone of the chromatic pair is played on the beat, followed by the lower-pitched tone of the same chromatic pair afterward on the offbeat.

In any case, keep the top fret on all the diagrams below on the *same* fret, except for the first diagram in the “fingering 3”, the second fret from the top is the same fret as the top fret on all the other diagrams.

fingering 1

HARMONIC APPLICATION OF HALF-WHOLE-HALF

Emphasis

Emphasize notes most commonly by putting them on the beat, by accenting, pivot tone, etc. Most commonly, you'll use half-whole-half interval parts of a diminished scale to emphasize a particular diminished seventh chord. The diminished seventh may be [used as V7b9 no root](#), I dim 7 in the case of a "[Goodman/Christian Im6b5](#)" or [#IVdim7 as in bar six of a jazz blues](#). In any case, treat the diminished seventh as follows:

Ascend half-whole diminished scale with the upper tone of each half step on tones of the diminished seventh target chord. Descend another half-whole diminished scale with the lower tone of each half step on tones of the dim7 target chord. Play perfect fourths ascending or descending in minor thirds with the upper tone of each perfect fourth on tones of the diminished seventh target chord.

Using V Diminished Half/Whole Scale as V7b9

To sound the V7b9 no root (II dim7) linearly with the V half/whole diminished scale, emphasize the upper note of each chromatic pair. In a minor key, de-emphasize the 13 of the V chord, since it is the unwanted natural three in the minor key. See also [Pairs Of Fourths Moving In Minor Thirds](#).

applying half-whole-half to harmonic minor type V chords

Harmonic minor V type chords can be effectively applied to I type (C), II type (Dm), IV type ("F") and VI type (Am) chords (examples were given in the key of "C"). In the key of each of these target chords, a V7b9 no root chord is a diminished seventh on 7, 2, 4 or b6 of the target chord (detail below).

Avoid playing more than seven consecutive notes linearly in the diminished scale. Apply diminished scale ascending half-whole from "#1" of the target root for 7b9 no root. Learn to make any of the four half-whole-half cells that make it up work melodically, by blending with common scales. These create harmonic minor V-I cadences (though the "I" chord may be minor or major).

Melodic Minor on Flat Six of Target

Flat six of a target chord is the tone on which to build a diminished seventh to represent V7b9 no root of the target. It is also the tone center of melodic minor that will build both b13#11 and V7#9b9#5b5 (super Locrian) of the target. Good to know.

locating diminished seventh for harmonic minor type V chords

Ascend half-whole diminished scale with the upper tone of each half step on VII dim7. Descend another half-whole diminished scale with the lower tone of each half step on VII dim7. Play perfect fourths diminished or descending in minor thirds with the upper tone of each perfect fourth on a VII dim7 tone.

The circled notes below are target roots. The V7b9 no root (diminished seventh) includes a note a half step below each potential target. The second table below shows each octave shape separately. After becoming familiar with that table, the top table below can serve as a summary.

the circled notes below are target roots

For each of the effective target chords, I, II, IV or VI type in each octave shape (E, D, C A or G form), you need to be able to locate the diminished seventh chord to represent its V7b9 no root. Since diminished sevenths are all minor thirds and can be named after either of their notes. Since the interval between I and VI is a minor third. Diminished sevenths are all minor thirds, so the diminished seventh (V7b9 no root for the respective target chord) for I and VI is the same. Likewise, the interval between IV and II is a minor third, so the diminished seventh (V7b9 no root for the respective target chord) for IV and II is the same.

I and VI chords share the same diminished seventh as part of their respective V7b9 no root chords. In the key of C, “C” is the I chord and “Am” is the VIIm chord. The V7b9 chord in C is G7b9. Without a root, G7b9 is B diminished seventh, with the synonyms B°7, D°7, F°7 and G#°7. In A, the key of the VI chord, V7b9 is E7b9. E7b9 no root is G# diminished seventh, which is a synonym of B diminished seventh.

IV and II chords share the same diminished seventh as part of their respective V7b9 no root chords. In the key of C, “F” is the IV chord and “Dm” is the IIIm chord. The V7b9 chord in F is C7b9. Without a root, C7b9 is E diminished seventh, with the synonyms E°7, G°7, Bb°7 and Db°7. In D, the key of the II chord, V7b9 is A7b9. A7b9 no root is C# (‘Db) diminished seventh, which is a synonym of E diminished seventh.

Applying Half-Whole-Half to Melodic Minor Type V Chords

A single half-whole-half cell from the root of a V type chord, making 5-b6-b7-7 (in the key of “I”, G-Ab-Bb-B in C) and elaborating it with the rest of V super Locrian (B super Locrian for the key of C) the mode on the seventh of bVI melodic minor (Ab melodic minor for the key of C). Continuing from “7” up to “6” in this mode would be all whole steps. (B-Db-Eb-F-G in the key of “C”).

Using I Diminished Scale As a “Goodman/Christian Im6b5

Ascend whole-half-diminished scale with the upper-pitched tone of each half step on I dim7.

Play perfect fourths ascending or descending in minor thirds with the lower-pitched tone of each perfect fourth on the beat and on a I dim7 tone.

This is a more vocal-oriented melodic approach found in many Benny Goodman songs with Charlie Christian on guitar. Think of a I diminished seventh chord as Im6b5. Im6b5 is the same as I dim7, but by thinking Im6b5, you are more likely to think of the individual character of each note.

The m6b5 chord has a flat third for bluesy sounds, which can be played with a microtonal bend. The flat third uses the #9 in the I13b9#9#11 chord. It functions as an upper neighbor to the root, in terms of a pentatonic upper neighbor. If you’ve heard the blues song “Spoonful” (written by Willie Dixon and recorded by Howlin’ Wolf and Cream), that’s the main theme, repeating flat three to one.

The m6b5 chord also has a flat five. The flat five should usually be used sparingly for a very dark, bluesy effect.

Arguably, the most significant swing era tone is six. The m6b5 chord has a six to get that swing color. It is the thirteenth in the I13b9#9#11 chord. Especially use the six as a lower neighbor to the root, which could be called a “low six”.

I diminished seventh has the same notes as #IVdim7, which is commonly bar six of a jazz blues. Use this Goodman/Christian approach for that chord.

To sound Im6b5 no root (I dim7) linearly with the I half/whole diminished scale, emphasize the lower note of each chromatic pair. The group of lower notes of the lower notes of each chromatic pair makes I dim7.

See also [Pairs of Fourths Moving in Minor Thirds / Emulating the Goodman/Christian Im6b5](#).

Applying Diminished Scale to 13b9 Chords (Optional b9 and #9)

If all the tones of the diminished scale are played at once (spread voicing with largely intervals of a third or more), it sounds the chord 13#11b9#9. So, the diminished scale can be used as chord sound, naming it G diminished scale (half-whole ascending from “G”) and equating the scale with G13#11b9#9.

This presents an exception to upper and lower chromatic embellishments. To sound the G7b9 part of G13b9#9#11 (harmonized diminished scale), use lower chromatic embellishments of the B dim7 ascending and descending. This means you would put the higher-pitched tone of each chromatic pair on the beat regardless of whether you’re ascending or descending. Also think of it as the “13b9#9#11” way to elaborate a 7b9 chord. This works particularly well on 13b9 chords with the flat nine in the bass. Here are some occurrences:

bar 9 of Alone Together

bar 3 of Corcovado (Quiet Nights Of Quiet Stars)

bar 3 of How Insensitive (play C#dim7 as C13b9/Db)

bar 6 of the B section of Meditation (play Ebdim7 as D13b9/Eb)

Stormy Weather in the repeating progression Gma7 G#dim7 Am7 D7,

treat the G#dim7 as G13b9/Ab

bars 3 and 4 of Witchcraft

See also [using perfect fourth pairs with the 13#11b9#9 exception](#).

Elaborating Half-Whole-Half with Scales and Chords

Elaborate half-whole-half cells by playing modes of major scale, harmonic minor or melodic minor immediately before or after them. Melodically blend Aeolian, harmonic minor, and melodic minor by alternating the versions of the notes that differ: 7-1-2. Tones b3-4-5-b6 are common to all three.

Key scale Phrygian flat one (bVI melodic minor) has b7-7(b1)-b2 . Key scale Aeolian flat one (bIII major flat six) has b7-7(b1)-2, differing only with its natural two.

Combine Cells for Practice

Refer to the table above. For V7b9 and III7b9, practice the diminished scale b7-7-#1-2-3-4-5-b6 and elaborating on each of the four cells that make it up. Also for V7b9 and III7b9, practice 7-1-2-b3-4-b5 and elaborate on each of the two cells that make it up (7-1-2-b3 and 2-b3-4-b5). For VI7b9, practice #1-2-3-4-5-b6 and elaborate on each of the two cells that make it up (#1-2-3-4 and 3-4-5-b6).

Half-Whole-Half Cells Don't Have to Be Complete Subsets

Each half-whole-half cell is typically used to emphasize two of its notes that are subsets of the chord it is being used on. The remaining two notes don't have to be in the scale that elaborates the half-whole-half cell. The notes that differ substantially, such as a major third during a minor chord, should be de-emphasized.

The musical score is written for guitar in E-flat major (three flats). It consists of six systems, each with a melodic line on a single staff and a corresponding fretboard diagram below it. The fretboard diagrams are labeled with 'T' for the thumb and 'A' for the index finger, with numbers 1-8 indicating fret positions. Chord symbols (D7(b9) and Gm) are placed above the melodic lines to indicate the harmonic context. The examples show various melodic patterns, including half-whole-half cells and diminished scale runs, with some patterns labeled as 'resolove down only'.

MAJOR SCALE LINES

The major scale can be visualized in a scanning fashion by looking at the notes going across the strings, parallel to the frets. At scale tones 2, 3 and 6 on the sixth string, the “lines” include notes all on the same fret.

line 1 - “three and four high”

notes on its third and fourth strings are one fret toward the guitar body

line 2 - “a straight line”

(2, 3 and 6)

line 3 - “a straight line”

(2, 3 and 6)

line 4 - “three, four and five high”

notes on its third, fourth and fifth strings are one fret toward the guitar body

line 5 - “three high”

the note on its third string is one fret toward the guitar body

line 6 - “a straight line”

(2, 3 and 6)

line 7 - “two low”

the note on the second string is one fret toward the head of the guitar

CHUNKING MAJOR SCALE LINES

forty two notes

The full-fretboard major scale pattern contains forty two notes. We cannot visualize that much information at once. We can, however visualize it in chunks of various kinds. Major scale chunking methods include major scale lines, in-position scale-tone triad subsets, in-position pentatonic scale subsets, triad arcs and linear triads by string set.

THREE-STRING MAJOR SCALE FINGERINGS

Based on the Three Bass Strings of In-Position Major Scale Fingerings

These three-string fingerings are designed for speed. Changing strings in picking is a common barrier to accomplish fast playing. It is easier to pick more notes on each string. These three-string fingerings have three notes per string and often extend to have four notes on some strings. They can be played very fast when well-memorized. When played in two or more octaves, they are also easy to recall because they use the same fingering on two or more sets of three strings.

These three-note per string fingerings are based on the fingerings on the three largest strings in the in-position major scale fingerings shown below. Usually strings 5-4-3 are best for fast playing.

the seven in-position major scale fingerings

These are numbered according to the number of the lowest pitch on the sixth (largest) string. Fingering 3, for example has major scale tone "3" as its lowest pitch. That would be C major scale fingering 3 in the twelfth position, where the lowest pitch on the sixth string is "E", the third step of the C major scale. Here are the seven in-position fingerings in numerical order:

fingering 1	fingering 2	fingering 3	fingering 4	fingering 5	fingering 6	fingering 7

the extractions from strings 6-5-4

fingering 1	fingering 2	fingering 3	fingering 4	fingering 5	fingering 6	fingering 7

the extractions from strings 6-5-4 replicated on strings 5-4-3 (best for fast playing)

fingering 1	fingering 2	fingering 3	fingering 4	fingering 5	fingering 6	fingering 7

the replications from strings 6-5-4 by formula (top row) and fingers (bottom row)

Inspect the fingering in the bottom row. Each two-string fingering on the sixth and fifth strings is duplicated on the fourth and third strings with one added note on the head side.

For example, in fingering 1, the first finger is used twice on the fourth string, first to fret scale tone “7”, then to begin the original 1-2-3-4-5-6 vsequence that occurred on the sixth and fifth strings.

The two-string fingering from strings six and five is then repeated again on strings two and one with an added note on the head side on strings two. In fingering 1, first finger is used twice on the second string, adding scale tone “7” to the original 1-2-3-4-5-6 sequence on the sixth and fifth strings.

fingering 1	fingering 2	fingering 3	fingering 4	fingering 5	fingering 6	fingering 7

TWO-STRING MAJOR SCALE FINGERINGS

Based on the Two Bass Strings of In-Position Major Scale Fingerings

These two-string fingerings are designed for the ultimate speed of playing major scales. They have two notes per string and include one out-of-position note on the larger of the two strings and another out-of-position note on the smaller of the two strings. They can be played very fast because they are easy to memorize and minimize changing strings.

These two-note per string fingerings are based on the fingerings on the two largest strings in the in-position major scale fingerings shown below.

the seven in-position major scale fingerings

These are numbered according to the number of the lowest pitch on the sixth (largest) string. Fingering 3, for example has major scale tone "3" as its lowest pitch. That would be C major scale fingering 3 in the twelfth position, where the lowest pitch on the sixth string is "E", the third step of the C major scale. Here are the seven in-position fingerings in numerical order:

fingering 1	fingering 2	fingering 3	fingering 4	fingering 5	fingering 6	fingering 7

the extractions from strings 6-5

fingering 1	fingering 2	fingering 3	fingering 4	fingering 5	fingering 6	fingering 7

the replications from strings 6-5 by formula (top row) and fingers (bottom row)

In each fingering, the index finger frets the two lowest-pitched two notes on each string.

strings 6-5 (formula numbers in the top row, finger numbers in the bottom row)

fingering 1	fingering 2	fingering 3	fingering 4	fingering 5	fingering 6	fingering 7

strings 5-4 (formula numbers in the top row, finger numbers in the bottom row)

fingering 1	fingering 2	fingering 3	fingering 4	fingering 5	fingering 6	fingering 7

strings 4-3 (formula numbers in the top row, finger numbers in the bottom row)

fingering 1	fingering 2	fingering 3	fingering 4	fingering 5	fingering 6	fingering 7

strings 3-2: (formula numbers in the top row, finger numbers in the bottom row)

these awkward fingerings require compressing the hand upon string changes

fingering 1	fingering 2	fingering 3	fingering 4	fingering 5	fingering 6	fingering 7

strings 2-1 (formula numbers in the top row, finger numbers in the bottom row)

fingering 1	fingering 2	fingering 3	fingering 4	fingering 5	fingering 6	fingering 7

THREE-OCTAVE MAJOR SCALE FINGERINGS

The top row is numbered by scale tone and the bottom row is numbered by fretting fingers.

fingering 1 based on two- string fingering 1	fingering 2 based on two- string fingering 2	fingering 3 based on two- string fingering 3	fingering 4 based on two- string fingering 4	fingering 5 based on two- string fingering 5	fingering 6 based on two- string fingering 6	fingering 7 based on two- string fingering 7

Construction of Three-Octave Major Scale Fingerings

on strings 6-5, ascend the first seven notes of the two-note-per-string fingering

The first row below is scale tone numbers and the second row is finger numbers.

fingering 1	fingering 2	fingering 3	fingering 4	fingering 5	fingering 6	fingering 7

on strings 4-3, ascend the first seven notes of the two-note-per-string fingering

The first row below is scale tone numbers and the second row is finger numbers. The fingering is modified so position changes only happen on the fourth string.

fingering 1	fingering 2	fingering 3	fingering 4	fingering 5	fingering 6	fingering 7

combine the seven notes on strings 6-5 and the seven notes on strings 4-3, ascending

The first row below is scale tone numbers and the second row is finger numbers.

fingering 1 based on two- string fingering 1	fingering 2 based on two- string fingering 2	fingering 3 based on two- string fingering 3	fingering 4 based on two- string fingering 4	fingering 5 based on two- string fingering 5	fingering 6 based on two- string fingering 6	fingering 7 based on two- string fingering 7

prepare to add the eight-note, two-note-per-string fingerings on strings 1-2

fingering 1	fingering 2	fingering 3	fingering 4	fingering 5	fingering 6	fingering 7

combine the seven notes on strings 6-5 & 4-3 and the eight notes on strings 2-1

The result shown below is the same as at the beginning of this section. The top row is numbered by scale tone and the bottom row is numbered by fretting fingers.

fingering 1 based on two- string fingering 1	fingering 2 based on two- string fingering 2	fingering 3 based on two- string fingering 3	fingering 4 based on two- string fingering 4	fingering 5 based on two- string fingering 5	fingering 6 based on two- string fingering 6	fingering 7 based on two- string fingering 7

DIATONIC VOICE LEADING

Diatonic Defined

“Diatonos” was one of three tunings of the Greek lyre (the other two were chromatic [khrōmatikós] and enharmonic [enarmonikós]). Diatonos meant “through” (dia) “tone” (tonos). It referred to the use of what we now call the major scale to make music. The Greeks began a tradition of modes that lasted until 1600. With modes, any tone of the major scale can be a tone center. See [Modes and Voice Leading](#).

During the common practice period of classical music from 1600-1910, most music was composed with either the first step or the sixth step as a tone center. This is reflected in the major-minor key signature system. There has since been a misconception (or changed conception) as to what “diatonic” means. It is commonly thought to refer to a two-tone system with major (Ionian) or relative minor (Aeolian) as the possible modes. “Dia” means “through”, implying the relationship between two *or more* things. The term is not “duo-tonic”, which would imply two tone centers.

Diatonic Cadence Exercises

The diatonic cadences shown here involve chord root movement ascending in perfect fourths. This is the backbone of European church, classical, American ragtime, blues, jazz and popular music. These cadences sound simple, but don’t overlook them. They are the canvas on which you can paint your masterpiece. If you know the concrete diatonic cadences, you can learn to abstract them and build all the colorful things done with them in jazz.

The examples below use four of the six directional types of turnarounds. See [II-V-I Cadences and Turnarounds/Building Turnarounds/Six Directional Types of Turnarounds](#).

[click here to play a video of the exercises below](#)

Tablature is not provided for these exercises. If you do not read standard notation, this may be a good time to start. If necessary, see Reading Notation/[Reading Standard Music Notation](#). Use major scale fingerings shown in [Prime Scales, Chords and Arpeggios/Major Scale Fingering](#). Once you can read them as they are written in the key of C, you can play them by fingering pattern and by scale-tone number, moving up or down the fretboard to different keys.

74 Fmaj7 Bm7(b5) 75 Em7 Am7 76 Dm7 G7 77 Cmaj7 Fmaj7 78 Bm7(b5) Em7 79 Am7

The musical notation shows three staves of music. The first staff contains measures 64-68, the second staff contains measures 69-73, and the third staff contains measures 74-79. Each measure is labeled with a chord name above it. The notation uses a treble clef and a key signature of one flat (Bb). The music consists of eighth-note arpeggios for each chord, with a repeat sign at the beginning of measure 65 and a double bar line at the end of measure 79.

GRAPHICALLY VOICE LEADING IMPROV WITH ARPEGGIO CADENCES

Also see the chapter [Voice Leading](#).

Driving Your Improv with Your Vocal-Compositional Imagination

Guitarists need to base their improvisation on their vocal/compositional imagination. A well-exercised and free musical imagination is very powerful. You've probably heard enough music to can extend ideas you've heard, if you can find what you're hearing on the guitar.

That's the challenge. You need to find what you're hearing on the guitar without moving your primary focus to the guitar. Your attention needs to stay on your imagination and the graphics on the guitar must be secondary.

Imagine Melody while Using the Graphic Context

A good exercise is to play a few consecutive notes of a scale while duplicating them with your voice. While repeating the notes, ascending and descending, gradually decrease your pressure on fretting the notes and pick or pluck softer and softer until you are still singing, but gesturing the notes in "air guitar" fashion. Then try to conjure up some order of the notes into a melodic theme in your mind and sing what you have come up with. Next, teach yourself the part on the guitar, being careful to keep the focus on your voice and your imagination.

You'll get better and better at imagining the sounds of scales and arpeggios until you won't need to sound them. Imagine being somewhere without a guitar and playing it in your mind. It's difficult, but you can learn to do it.

Don't let the graphics of the guitar drive your melody. Drive your melody with your imagination and use the graphic view of the guitar as a tool to play what you hear.

Scale-Tone Triad Arpeggios in Stepwise Order, Numbered By Parent Major Scale (includes **secondary dominants**)

Memorize all these arpeggios in order for each octave shape and their options for secondary dominants to be an expert improviser. See [Stepwise Major Scale-Tone Seventh Arpeggios by Finger Number](#) for fingerings. In the diagrams below, seventh chord tones are black-backed. The alternate tones to make a secondary dominant (major or augmented) are gray-backed. I and IV triads are changed to augmented.

Four-Note Linear Arpeggios on Three Strings

Four-note linear arpeggios usually bridge three consecutive strings (occasionally two and rarely four).

Visualize the Target Tone

Visualize the target chord on the fretboard (the triad is best) and choose a target tone from it to begin the next chord from. The interval between the setup tone and the target tone that begins the next chord should usually be a minor third or less.

Begin with Core Melody

Start by using four-note-per-chord core melody. Rules are similar for three-note-per-chord core melody.

Free-Form with Skips and Whimsical Order

use skips up to a sixth

Use a skip up to an interval of a sixth to the setup tone neighbor of the target tone. The exception is the interval from the setup tone to the target tone, which is usually a minor third or less.

chord tones in whimsical order

Chord tones of each chord may be in whimsical order, involving skips.

resolving each chord tone as a setup tone to its target tone

A setup tone fifth or seventh resolves up or down. A setup tone root or third needs a substitute tone to avoid redundancy.

MODAL SECONDARY DOMINANTS

Specifically “Major Scale Modal” Dominants

Modes can be conceived in harmonic minor, melodic minor or Aeolian major (major flat six) scales, but this section is showing modal secondary dominant of the major scale. Each mode of the major scale is converted to a scale that includes a dominant seventh, except Mixolydian, which already contains a dominant seventh.

only change the necessary tones

In changing each mode of the major scale into a major scale modal dominant scale type, only change the necessary notes to include a dominant seventh chord. See the table below. A modal V type is a secondary dominant built on the fifth step of the target chord.

major scale modal dominant scales to be used as secondary dominants (modal V types)

target →	I	II	III	IV	V	VI
major modal V type	V Mixolydian	VI Aeol. dom.	VII Phry. dom.	I Mixolydian	II Mixolydian	III Phry. dom.
key scale	I major	I major #1	I Lydian #2	I Mixolydian	I Lydian	I major #5

BUILDING VOICE LEADING WITH **SECONDARY DOMINANTS**

Start with Simple Core Melody

Core melody with [voice leading](#) builds the foundation of melody. If the chord durations are two to four beats each, begin by choosing one note per chord. Core melody can be elaborated through each of the steps from a triad to two notes, three or four notes, then further elaborated to full composed or improvised melody, but let's start by studying simple core melody with one note per chord.

key scale numbers

It's usually best to think core melody [voice leading](#) in terms of key scale numbers. In most cases, you will be voice leading scale-tone chords or secondary dominants (see [Secondary Dominant/Scale-Tone Secondary Dominants](#)).

When using a [flat five substitute](#), it is usually a bII Lydian dominant and can be thought in terms of it's scalar synonym V super Locrian, to think in key scale.

keep the number of notes in mind for each chord down to three to five notes

Follow George A. Miller's chunking principle (expressed in his 1956 paper "The Magical Number Seven, Plus or Minus Two: Some Limits on Our Capacity for Processing Information"). The average person can memorize a set of around seven characters or items, a "chunk" of seven items. Due to the elements of which string and which fret, each note is a pair of numbers (third string, seventh fret). In a sense, each note is a "chunk" of two items, the string and fret. So, we should keep the number of notes down five or less.

graphic visualization

We do also have the graphic image of the notes, which may include other helpful elements such as the triangle shape on the top of the G7 arpeggio shown below. In the same G7, the pair of notes on the first and third strings are on the same frets. Though it is better to know the key scale number for each chord tone, having an arpeggio memorized by its graphic image (visualizing a chord style diagram) can be very effective.

Core Melody **Voice Leading** for V-I

Measure 1: G7. Key scale tones: 7, 1. Fret numbers: 7, 8.

Measure 2: C6. Key scale tones: 7, 5, 4, 7, 1, 3. Fret numbers: 7, 8, 10, 9.

Measure 3: G7. Key scale tones: 2, 5. Fret numbers: 10, 8.

Measure 4: C6. Key scale tones: 7, 1, 2, 1, 7, 6, 5, 1. Fret numbers: 10, 8, 10, 8, 7, 10, 8, 8.

Core Melody **Voice Leading** for Major II-V-I

Each example below shows a simple core melody of one note per chord, then an elaboration. The first elaboration (in bar three) was chord tones (numbered by key scale). The second elaboration (in bar four) was scale tones in addition to chord tones (numbered by key scale).

Core Melody **Voice Leading** for Minor II-V-I

Core Melody **Voice Leading** for Major I-VI-II-V-I

Voice Leading the Last Tone of the V7 Setup Arpeggio or Scale

number the tones in terms of the target I chord key

With a little initial memorization, this makes voice leading much more straightforward. The root, third, fifth and flatted seventh of the V7 setup chord are respectively 5-7-2-4 in the key of the target I chord.

the root of the V7 setup ("5" in the key of the target) is skipped and resolves with scalar encircling

The root of the V type setup chord is the same note as the fifth of the target I chord. Whether ascending or descending, if the last tone would be the root of the setup chord, it is the fifth of the target chord and would cause redundancy. Skip key "5", pass it by one tone, then turn back and resolve it ("5" in the key of the target I chord).

the third of the V7 setup ("7" in the key of the target) resolves up to the root of the target

Whether ascending or descending, if the last setup tone is the third of the V7 chord ("7" of the key), resolve up to the root of the target I chord.

the fifth of the V7 setup ("2" in the key of the target) resolves to the root or third of the target

Whether ascending or descending, if the last setup tone the fifth of the V7 chord ("2" of the key), , resolve down to the root or up to the third of the target I chord.

the flatted seventh of the V7 setup ("4" in the of key the target) resolves to the third or fifth of the target

Whether ascending or descending, if the last setup tone the flatted seventh of the V7 chord ("4" of the key), resolve down to the third or up to the fifth of the target I chord.

the ninth or flatted ninth of the V7 setup ("6" or "b6" In the target's key) resolves down to the fifth of the target

The ninth or flatted ninth can be added to the V7 setup chord, making V9 or V7b9, respectively. Nine and flat nine of the setup V chord are the sixth or flatted sixth in the key of the target I chord. Whether ascending or descending, if the last setup tone is the ninth or flatted ninth of the V7 setup chord ("6" or "b6" in the key of the target I chord), you can resolve down to the fifth of the target I chord.

the ninth of the V7 setup ("6" in the key of the target) resolves up to the root of the target

The ninth (not the flatted ninth) as an added to the V7 setup chord, making V9 chord is the sixth of the target I chord. Whether ascending or descending, if the last setup tone is the ninth of the V7 setup

chord (“4” of the key), you can resolve up to the root of the target I chord. This larger minor third interval from the sixth to the root of the target I chord is common to swing and R&B. This sixth is referred to as a low sixth in this relationship.

Voice Leading the V7 Secondary Dominant Arpeggio

The tones of the V7 chord are 5-7-2-4, in terms of the target I chord key. Typical four-note sequences of the V7 arpeggio tones, with those numbers, are shown below in the far left column.

ascending tones in the key of the target I chord	descending order, key of I	numbered tones in the key of the V7 chord	letter names for the target key of C
5-7-2-4	4-2-7-5	1-3-5-b7	C-E-G-Bb
7-2-4-5	5-4-2-7	3-5-b7-1	E-G-Bb-C
2-4-5-7	7-5-4-2	5-b7-1-3	G-Bb-C-E
4-5-7-2	2-7-5-4	b7-1-3-5	Bb-C-E-G

Voice Leading Eight-Note Scalar Cadences with Secondary Dominants

Once you are accustomed to playing eight-note scalar cadences, you can build more interesting phrases by omitting some of the first notes and varying the rhythm. See [Modal II-V-I Cadences and Turnarounds/ Favored Turnarounds/ Favored Four-Note Rhythms for the First Chord in a Turnaround](#) and [Triplet Rhythms for Any Chord in a II-V-I Cadence](#).

This same voice leading strategy will be used for scalar cadences with Harmonic V Type Secondary Dominant. See [Voice Leading Eight-Note Scalar Cadences with Harmonic Minor V Type Secondary Dominants](#).

using setup chord with eight linear heptatonic (seven-tone) scale tones

The voice leading is straight forward with eight linear (ascending or descending without skips) of a seven-tone scale. The first note is the same as the last note, so it is relatively easy to think the voice leading as described earlier in [Voice Leading the Last Tone of the V7 Setup Arpeggio or Scale](#). The chord scale for the setup chord includes the tones of the seventh chord. Use eight linear setup chord scale tones (eighths at a fast tempo or sixteenths at a slow tempo) to represent the setup chord. Linear scale tones ascend or descend the scale by step, without skips.

Play the eight linear heptatonic (7 tone scale) setup tones in the last half of the bar preceding the target. With an octave of linear notes as a setup to target chord triad tones the root of the setup is to only tone common to the target triad.

Voice Leading Four-Note Scalar Cadences with Secondary Dominants

The chord scale for the setup chord includes the tones of the seventh chord. Use eighth notes at a fast tempo or sixteenth notes at a slow tempo. Play them during the last beat or two of the bar preceding the target I chord.

ascend 1-2-3-5 from the root, third or fifth of the V chord, resolve up or down

Ascend 1-2-3-5 from the root of the V chord, then resolve down to the root of the target I chord or up to the third of the target I chord. Ascend 1-2-3-5 from the third of the V chord, then resolve down to the third of the target I chord or up to the fifth of the target I chord. Ascend 1-2-3-5 from the fifth of the V chord, then resolve down to the fifth of the target I chord or up to the seventh of the target I chord. If you resolve up to the seventh of the I chord, it helps to immediately continue down the I chord (at least to its fifth) or up the I chord (at least to its ninth),

descend linearly from any tone of the V7

Descending four tones from any tone in the V7 can resolve to a tone of the I seventh chord (Ima7, I7, Im7, whatever its type).

Voice Leading Improv with Substitute Chords

- **Substitute Progressions**
- **Substitutes with Pentatonic Scales and Modes**
- **Harmonic Minor V Type Secondary Dominant**
- **Flat Five Substitute of Secondary Dominant**
- **Super Locrian Type Secondary Dominant**
- ^ **Modal Chord Progression with Substitutes**
- **Major II-V-I with Substitutes**
- **Minor II-V-I with Substitutes**
- **I-VI-II-V with Substitutes**
- **VII-III-VI-II-V-I-IV with Substitutes**

SUBSTITUTE PROGRESSIONS

Building Melody By **Voice Leading** Substitute Arpeggios

Usually I and II chords are not changed. VI and V chords are usually substituted with either:

1. a harmonic minor V type of target (E7b9 to Am7; or G7b9 to C or to Cm)
2. a **flat five substitute** (Bb13#11 to Am7 or Db13#11 to C or to Cm)

Bebop Melodic Development:

do the following steps within a confined area on the fretboard:

1. Conceive substitute chords (re-harmonize) with **voice leading**, expressed in chord fingerings, commonly two beats per chord, especially for cadences. See [Substitution](#).
2. Decide on arpeggio and scale fingerings and memorize them (you need to the steps that follow below to make those decisions).
3. Make up a simple three or four-note thematic cell for each chord so the sequence of chord with their cells embody **voice leading** through the series of chords. See [Voice Leading](#).
4. Build two-bar core melody with two or four notes per chord with the cells (see the chapters [Core Melody Built with Duality Tones](#), [Core Melody with Baroque-Bebop Ornamentation](#)).
5. Decorate the cells with bebop ornamentation, scales or arpeggios.

Thinking Substitute in Key Scale

To be able to conceive good **voice leading**, it is essential to be able to think the scale you are using in key scale. For example, in the chord progression Ima7-VI7b9-IIIm7, you could play II harmonic minor during the VI7b9 chord, making it a V7b9 in the key of the II minor chord . By thinking of the II harmonic minor scale as a key scale #I Mixolydian (which has the same notes as II harmonic minor) you can recognize that scale tone “1” in the I chord can chromatically voice lead to “#1” in the VI7 chord. Also, “7” in the I chord can move chromatically down to “b7” in the VI7b9 chord and continue chromatically to the “6” of the key in the IIIm7 chord.

Replacing Or Playing With?

when you replace, a substitute chord replaces the original accompaniment chord

When you *replace* a chord with a substitute, the substitute chord replaces the original accompaniment chord *and* the substitute chord is used in the improvised melody. If the original chords were Cma7-Am7-Dm7-G7-Cma7 and you replaced the Am7 with A7b9, making Cma7-A7b9-Dm7-G7-Cma7. The accompaniment would play A7b9 as the second chord and you would melodically emphasize the tones of A7b9 during the A7b9 chord.

when you play a substitute chord with the original accompaniment chord

When you improvise melody to *represent a substitute chord along with the original chord*, both the original chord and its substitute can be heard. It is important that the original chord and its substitute are compatible. Chord synonyms have the same notes with a different name, such as B7b5 (B-D#-F-A) and F7b5 (F-A-Cb-Eb). Note that D# and Eb are enharmonically the same note and that B and Cb are enharmonically the same note. If improvised melody represents a synonym of the original chord, the melody is usually harmonically acceptable.

There are many cases where the substitute chord may clash with the original. For example, a [flat five substitute](#) is sometimes misused where the original chord is not a dominant seventh type chord, such as Dm7 in the key of C, and it is improved upon with a “flat five substitute”, which would be Ab7. An altered Ab7 could make acceptable altered synonyms of an altered D7 chord such as D7b5b9 (D-F#-Ab-C-Eb), where the altered Ab7 chord would be Ab7#11. Combining Dm7 in the accompaniment with Ab7#11 would be disastrous, unless at such a fast tempo that the harmonic mismatch was unnoticed.

use the [flat five substitute](#) correctly

Think of a flat five substitute as a *dominant flat five substitute*, implying that the chord being replaced (Dm7) should be a dominant chord. If you want to apply a flat five substitute to a minor or diminished chord, first change it to a dominant seventh in the accompaniment. Replace Dm7 with D7 in the accompaniment, then imply Ab7 (flat five substitute of D7) in the melody.

HARMONIC MINOR V TYPE SECONDARY DOMINANT

Using Diminished Seventh to Represent Harmonic Minor V Type Setup Chords

an easy way to get a sophisticated sound with diminished sevenths

This is a relatively easy way to get a sophisticated jazz sound with few fingerings. There are only three diminished seventh arpeggio fingerings for all keys. Take advantage of that by using diminished seventh built on the tone a half step (one fret) below the root of the target chord. Use a four-note diminished seventh arpeggio at the end of the bar preceding the target chord on beat one.

how this works

If C, Cma7 or Cm7 is your target chord, the setup chord that immediately precedes it can be a harmonic minor V type, G7b9. Without a root, a 7b9 chord (five notes) is a diminished seventh, which can be named after any of the tones in the diminished seventh, which are the third, fifth, flat seventh or flat nine of the G7b9. If you identify one note by name in a complete four-four-note diminished seventh chord fingering, you can name the remaining notes from the chord fingering.

the three in-position diminished seventh arpeggio fingerings

Use “chunking” by memorizing the groups of notes shown with diagonal lines in the diminished seventh ‘George A. Miller wrote “The Magical Number Seven, Plus or Minus Two”, which referred to the number of digits a human can typically memorize. This is why phone numbers have seven digits (though the phone number system was in place long before 1956).

His strategy was “chunking” items by grouping them according to commonality. This allows us to memorize more data. In this case, we are chunking notes of the arpeggios into diagonal two or three-note chords, so we memorize three or four chords and may need to add a single note or two.

fingering 1

fingering 2

fingering 3

segue in and out with your existing style of improv

Start in 4/4, in eighths at a fast tempo (over 120 BPM, ideally starting around 180 BPM), start the four-note diminished seventh on beat three. Or, start in 4/4, in sixteenths at a slow tempo (under 120 BPM, ideally starting around 90 BPM).

Make a loop of a short chord progression. Determine a target chord. For example, play one bar of Em7 and one bar of B7. First improvise in your existing style. Next, work at playing continuous eighths or continuous sixteenths (as described in the paragraph above).

segue in to the turnaround

The “turnaround” is four notes of the setup VII dim. 7 at the end of the setup bar (B7) and four notes of the target on the first beat of the next bar (Em7). Play continuous eighths or sixteenths in the first half of the bar preceeding the target chord. Then play four ascending notes of the diminished seventh built a half step below your target at the end of the bar. If in 4/4 with eighth notes, play four eighths of the VII dim7 beginning on beat three. Continue with “segue out” below.

segue out of the turnaround

If in 4/4 with sixteenth notes, play four sixteenths of the VII dim7, beginning on beat four. On beat one of the next bar, continue playing at the same rhythmic level (eighths or sixteenths) and “segue out” into your existing improv.

turnaround designs

Two four-note arpeggios can form a turnaround by playing one of them at the end of a setup chord bar (BD#dim7 to represent B7) and another at the beginning of the target chord bar (Em7). The designs of these can be any of the following: up-down, down-up, up-up, down-down, up-continue up, - down-continue up. Up-down would be going up in pitch on the D#dim7 and down in pitch on the Em7. See [Fly Me to the Moon with Harmonic Minor V Secondary Dominants](#) the [video of the exercise](#) to study these designs.

Voice Leading the Harmonic Minor V7 Type Arpeggio

The same voice leading strategy can be used for harmonic minor V Type secondary dominant arpeggios as is described earlier in [Voice Leading the V7 Secondary Dominant Arpeggio](#). Use the root, fifth and flatted seventh of the harmonic minor V7b9 setup chord.

Voice Leading Eight-Note Scalar Cadences with Harmonic Minor V Type Secondary Dominants

The same eight-note voice leading strategy can be used for harmonic minor V Type secondary dominants as is described earlier in [Voice Leading Eight-Note Scalar Cadences with Secondary Dominants](#). Use the root, fifth and flatted seventh of the harmonic minor V7b9 setup chord.

Voice Leading Four-Note Scalar Cadences with Harmonic Minor V Type Secondary Dominants

The same four-note voice leading strategy can be used for harmonic minor V Type secondary dominants as is described earlier in [Voice Leading Four-Note Cadences with Secondary Dominants](#). Use the root, fifth and flatted seventh of the harmonic minor V7b9 setup chord.

FLAT FIVE SUBSTITUTE OF SECONDARY DOMINANT

Building Turnarounds with Flat Five Substitute Arpeggios

The *dominant* is the fifth of a target. G7 is the dominant seventh of C (Cma7, C7, C6 or any type of C chord with a perfect fifth). The flat five substitute uses a dominant seventh on the flatted fifth of the dominant (flat five of five: Db is the flat five of G for the target chord C). The flat five of five is equivalent to flat two, which is easier to think on the fretboard. If the target is “C”, the flat five substitute of the dominant (G) is Db7.

Build dominant seventh arpeggios (Db7) to precede your target chord one fret above the root of the target chord. If C, Cma7 or Cm7 is your target chord, the setup chord that immediately precedes it can be a bII7 chord. Use only the F7 to E7 in this Flat Five Substitute exercise and figure out how to play the same notes in various positions.

Voice Leading the bII Arpeggio (the Flat Five Substitute)

Resolve by a small interval. Resolving to a triad tone of the target is dependable.

the root of the bII7 chord ascends 1-2-3-5 or descends 5-3-2-1 in bII Lydian dominant

Ascend up from the root or down to the root of the bII7 chord. Since the bII7 doesn't resolve well, use a 1-2-3-5 structure based on the root of the bII. Ascend 1-2-3-5 where “1” is the bII of the key. Or, descend 5-3-2-1, where “1” is the bII of the key. Db7 to C7 “melodic minor IV type secondary dominants up down (or down up) from the root” uses 1-2-3-5 on Db (Db-Eb-F-Ab) and resolves to a nearby triad tones of C major (C-E-G).

the third of the bII7 chord ascends the bII9 to the ninth, or descends the ninth of bII9 to the third

The third of the bII7 chord ascends a m7b5 from key 4 or descends m7b5 from key b3. Ascend up from the third or down to the third of the bII7 chord. Db9 to C9 “melodic minor IV type secondary dominants up down (or down up) from the third” uses a m7b5 on the third (F-Ab-Cb-Eb) and resolves to a nearby ninth chord tones of C9 (C-E-G-Bb-D).

the fifth of the bII7 chord: ascend or descend a minor sixth rooted on the fifth of bII9

Db7 to C7 “melodic minor IV type secondary dominants up down (or down up) from the fifth” uses a minor sixth arpeggio on the fifth of the Db7 setup chord (Ab-Cb-Eb-F on Db7) and resolves to a nearby triad tones of C major (C-E-G).

the flatted seventh of the bII chord: ascend or descend a ma7#5 arpeggio on the b7 of the bII chord

Db7 to C7 “melodic minor IV type secondary dominants up down (or down up) from the flatted seventh” uses a ma7#5 arpeggio on the flatted seventh of the setup chord (Cb-Eb-G-Bb on Db7) and resolves to a nearby triad tones of C major (C-E-G)

Voice Leading Eight-Note Scalar Cadences with Flat Five Substitutes

using setup chord with eight linear scale tones

The chord scale for the setup chord includes the tones of the bII seventh chord. Use eight linear Lydian dominant scale tones (eighths at a fast tempo or sixteenths at a slow tempo) to represent the setup chord. Linear scale tones ascend or descend the scale by step, without skips.

Play the eight linear Lydian dominant setup tones in the last half of the bar preceding the target. With an octave of linear notes as a setup to target chord triad tones the root of the setup is to only tone common to the target triad.

the root of the bII7 chord resolves down a half step, whether ascending or descending

Since you are playing the bII Lydian dominant scale for an octave, it will begin and end on the same note, the flat two of the target. So, whether ascending or descending, resolve down a half step to the root of the target I chord.

the third of the bII7 setup chord resolves up or down

The third of the bII7 chord is “4” in the target key. Whether ascending or descending the bII Lydian dominant setup scale, resolve down to the third of the target I chord or up to the fifth of the target I chord.

the fifth of the bII7 setup chord resolves down to the fifth of the target I chord

The fifth of the bII7 chord is “b6” in the target key. Whether ascending or descending the bII Lydian dominant setup scale, resolve down to the fifth of the target I chord.

the flatted seventh of the bII7 setup chord resolves up to the root of the target I chord

The flatted seventh of the bII7 chord is “7” in the target key. Whether ascending or descending resolve up to the root of the target I chord.

SUPER LOCRIAN TYPE SECONDARY DOMINANT

Super Locrian V Type Is a Synonym for Flat Five Substitute

The harmonized V super Locrian scale is the V7#5b5#9b9 chord. The flat five substitute of that scale and chord is the bII Lydian dominant scale and its harmonized chord, bII13#11. These two scales share the same notes, so they are synonyms. Likewise, their harmonized versions, the V7#5b5#9b9 chord and the bII13#11 chord are synonyms. For a target C chord, its super Locrian scale is spelled G-Ab-Bb-Cb(B)-Db-Eb-F-G. The bII Lydian dominant scale for the key of C is spelled Db-Eb-F-G-Ab-Bb-Cb(B), which is the same notes.

Use Super Locrian For Scalar Cadences

Super Locrian is difficult to voice lead, because of its lack of regular alternating major and minor thirds and uncommon intervals, such as a whole step between three and flat five (three to five is usually a major or minor third). So, rather than breeching this unnessessary task, voice lead its synonym the bII Lydian dominant scale and its harmonized chord bII13#11.

To use super Locrian for linear scalar cadences (ascending or descending the scale without skips), voice lead its last tone before the target. More so than with other secondary dominant types, the scale passage can have any number of notes. You may be able to voice lead a super Locrian setup scale passage to a target I chord intuitively, but some of the resolutions will work better if you have memorized them. For example, ascending the super Locrian scale key scale “7” as the last note before a target I chord root is “chromatically crowded” and confusing to listen to. It would resolve better if you skipped key scale “7”, played key scale “b2”, then resolved to key scale “1” (the root of the target I chord).

Here is a table of the resolutions from the last note:

voice leading from the last note of of the setup chord

last tone of V super Locrian, numbered in the key of the I target chord	scalar encircling, numbered in the key of the I target chord	resolution in the I target chord, numbered in the key of the I target chord
5 (G in the key of C)	pass “5”, play “b6”, resolve to “5”	5
b6 (Ab in the key of C)		5
b7 (Bb in the key of C)		1
7 (=b1, B in the key of C)	skip “7”, go on to key “b2”, resolve to “1”.	1
b2 (Db in the key of C)		1
b3 (Eb in the key of C)		3
4 (F in the key of C)		3

Super Locrian V Type Arpeggio Cadence Exercises - V7#5 Of Target

Tablature is not provided for these exercises. If you do not read standard notation, this may be a good time to start. If necessary, see [Reading Notation/Reading Standard Music Notation](#). Use major scale fingerings in [Prime Scales, Chords and Arpeggios/Major Scale Fingering](#). Once you can read them as they are written in the key of C, you can play them by fingering pattern and by scale-tone number, moving up or down the fretboard to different keys.

MODAL CHORD PROGRESSION WITH SUBSTITUTES

Afro Blue with Substitute Chords - [click to play video](#)

In this improv study, the Afro Blue chord progression is largely treated like a continuous Fm7 or Fm11 chord. The setup chords that lead into Fm are noted, which happen mostly in the second and fourth of each four bars, setting up the target Fm on the first beat of the third or first bar, respectively. Other melodic designs are used and are noted, such as the diminished scale with pairs of perfect fourths moving in minor thirds, the 1-2-3-5 fragment (a triad with neighbor) in perfect fourths, quartal harmony and quintal harmony. With Scale Ambiguity, F Aeolian predominates over F Dorian. Though the chords are from F Dorian, listeners are more familiar with F Aeolian. Care was taken to not sustain or otherwise overemphasize the "Db" note of F Aeolian during the G minor chord, which contains the "D natural" note.

The musical score is presented in four systems, each with a treble staff and a bass staff. Fingerings are indicated by numbers 1-5. Chord labels and melodic fragments are noted above the staves.

System 1 (Measures 1-4):

- Measures 1-2: Fm7, Gm7. Bass line: 1 3 3, 4 6.
- Measure 3: C7b9 (3 3 2 1), A♭maj7 (2 4 2 3 4 5).
- Measure 4: Gm7, Fm7. Bass line: 2 2, 3 3. Melodic fragment: G♭1235 (2 4 1 4).

System 2 (Measures 5-8):

- Measures 5-6: Fm7, Gm7. Bass line: 3 3 3 1 3 4 1 3 1, 5/6 5 3 5 6 3 5.
- Measure 7: A♭maj7, Gm7. Bass line: 1 1, 3 3 3 1 4 3 1 1.
- Measure 8: Fm7. Bass line: 1 4 3 2 1 3 3 2 1. Melodic fragment: C7b9 (3).

System 3 (Measures 9-12):

- Measures 9-10: Fm7, Gm7. Bass line: 1 3 1 3 1 2 3, 6 3 5 6 3.
- Measure 11: A♭maj7, Gm7. Bass line: 1 2 3 1, 3 1 4 1 1 2 1 4.
- Measure 12: Fm7. Bass line: 3 2 1 4 1 2 2 1 4. Melodic fragments: C7b9 no root = E dim 7, Db13, Eb maj. triad, E maj. triad.

System 4 (Measures 13-16):

- Measures 13-14: Fm7, Gm7. Bass line: 4 1 2 1 2 1, 1 4 3 1 4 2 4.
- Measure 15: A♭maj7, Gm7. Bass line: 2 4 1 2 3 1, 4 6 3 4 5 1.
- Measure 16: Fm7. Bass line: 3 3 3 0 0 0 1 1 1. Melodic fragment: Eb maj. triad = "top of Fm11" (3).

I-VI-II-V WITH SUBSTITUTES

Decide on Ima7 type or I7 type for the “I” chord and use the appropriate table (Ima7 type or I7 type). Choose one chord from each category I, VI, II and V. Your choices don’t have to be in the same row.

Placement of Scales In Keys Other Than “I”

When arpeggios in this section use scales built on scale tones other than “I”, are numbered on the diagram in relation to the indicated tone. “bII Lydian dominant” in the key of C would be “Db Lydian dominant” and in the diagrams for it, Db is “1”.

placing Lydian dominant and its arpeggios on the fretboard

With bII Lydian dominant (in the “V” chord columns), determine “b2” of the key you are playing in. In the key of C, “b2” would be “Db”. Use these chord tones for each of the two bII Lydian dominant chord types:

column	chord name above diagram	use numbered chord tones on the diagram	scale name above the diagram	tone center number on the diagram	number for the root of chord on the diagram
VI	bIII7	1-3-5-b7	bIII Lydian dominant	1	1
VI	Vm7b5	3-5-b7-2	bIII Lydian dominant	1	3
column	chord name above diagram	use numbered chord tones on the diagram	scale name above the diagram	tone center number on the diagram	number for the root of chord on the diagram
V	bII7	1-3-5-b7	bII Lydian dominant	1	1
V	IVm7b5	3-5-b7-2	bII Lydian dominant	1	3

placing #1 half/whole diminished and its arpeggios on the fretboard

column	chord name above diagram	use numbered chord tones on the diagram	scale name above the diagram	tone center number on the diagram	number for the root of chord on the diagram
V	IIdim7	2-4-b6-7	“#1”half/whole diminished	#1	#1

Descend from the Fifth of Ilm7, Design the V

Ascend from the Flatted Seventh of IIm7, Design the V

This musical score is for a bebop phrase. It consists of four systems, each with a treble clef staff and a guitar staff. The key signature has one flat (Bb). The phrase starts at measure 136 and ends at measure 152. The chords are: Cmaj7, Dm7, G7, Cmaj7, Dm7, G7, Cmaj7. The melody is an ascending line starting on Bb4, moving through C5, D5, E5, F5, G5, A5, Bb5, and ending on C6. The guitar staff shows the fretting for the melody and the harmonic structure.

Descend from the Flatted Seventh of IIm7, Design the V

This musical score is for a bebop phrase. It consists of four systems, each with a treble clef staff and a guitar staff. The key signature has one flat (Bb). The phrase starts at measure 153 and ends at measure 169. The chords are: Cmaj7, Dm7, G7, Cmaj7, Dm7, G7, Cmaj7. The melody is a descending line starting on C6, moving through Bb5, A5, G5, F5, E5, D5, C5, and ending on Bb4. The guitar staff shows the fretting for the melody and the harmonic structure.

This musical exercise consists of four systems, each with a treble clef staff and a guitar fretboard diagram below. The first system (measures 85-89) features a Dm7 chord at the start and end, with G7 and Cmaj7 in between. The second system (measures 90-93) also starts and ends with Dm7, with G7 and Cmaj7 in between. The third system (measures 94-97) starts and ends with Dm7, with G7 and Cmaj7 in between. The fourth system (measures 98-101) starts and ends with Dm7, with G7 and Cmaj7 in between. The fretboard diagrams show the descending lines for the IIm chord (Dm7) and the V9 chord (G7) in C major, with fingerings indicated by numbers 1-4 and 7-10.

Design the IIm, Ascend from the Fifth of V7

Design the IIm, Descend from the Fifth of V7

Design the IIIm, Ascend from the Flatted Seventh of V7

This musical exercise is written for guitar in standard tuning. It consists of four systems of music, each with a treble clef staff and a bass staff. The key signature has one flat (Bb). The exercise is divided into measures 136 through 152.

System 1 (Measures 136-138): Chords: Cmaj7, Dm7, G7, Cmaj7. The melody starts on Bb4 and ascends stepwise to C5. The bass line starts on Bb1 and ascends stepwise to C2.

System 2 (Measures 139-141): Chords: Dm7, G7, Cmaj7, Dm7, G7, Cmaj7. The melody starts on C5 and ascends stepwise to D5. The bass line starts on C2 and ascends stepwise to D3.

System 3 (Measures 142-144): Chords: Dm7, G7, Cmaj7, Dm7, G7, Cmaj7. The melody starts on D5 and ascends stepwise to E5. The bass line starts on D3 and ascends stepwise to E3.

System 4 (Measures 145-147): Chords: Dm7, G7, Cmaj7, Dm7, G7, Cmaj7. The melody starts on E5 and ascends stepwise to F5. The bass line starts on E3 and ascends stepwise to F3.

System 5 (Measures 148-150): Chords: Dm7, G7, Cmaj7, Dm7, G7, Cmaj7. The melody starts on F5 and ascends stepwise to G5. The bass line starts on F3 and ascends stepwise to G3.

System 6 (Measures 151-152): Chords: Dm7, G7, Cmaj7, Dm7, G7, Cmaj7. The melody starts on G5 and ascends stepwise to A5. The bass line starts on G3 and ascends stepwise to A3.

Design the IIIm, Descend from the Flatted Seventh of V7

This musical exercise is written for guitar in standard tuning. It consists of four systems of music, each with a treble clef staff and a bass staff. The key signature has one flat (Bb). The exercise is divided into measures 153 through 169.

System 1 (Measures 153-155): Chords: Cmaj7, Dm7, G7, Cmaj7. The melody starts on A5 and descends stepwise to G5. The bass line starts on A3 and descends stepwise to G3.

System 2 (Measures 156-158): Chords: Dm7, G7, Cmaj7, Dm7, G7, Cmaj7. The melody starts on G5 and descends stepwise to F5. The bass line starts on G3 and descends stepwise to F3.

System 3 (Measures 159-161): Chords: Dm7, G7, Cmaj7, Dm7, G7, Cmaj7. The melody starts on F5 and descends stepwise to E5. The bass line starts on F3 and descends stepwise to E3.

System 4 (Measures 162-164): Chords: Dm7, G7, Cmaj7, Dm7, G7, Cmaj7. The melody starts on E5 and descends stepwise to D5. The bass line starts on E3 and descends stepwise to D3.

System 5 (Measures 165-167): Chords: Dm7, G7, Cmaj7, Dm7, G7, Cmaj7. The melody starts on D5 and descends stepwise to C5. The bass line starts on D3 and descends stepwise to C3.

System 6 (Measures 168-169): Chords: Dm7, G7, Cmaj7, Dm7, G7, Cmaj7. The melody starts on C5 and descends stepwise to Bb4. The bass line starts on C3 and descends stepwise to Bb2.

CONCEIVE THE COMPING AND MELODY TOGETHER

Before playing a cover song and improvising on it, you need to conceive the accompaniment (comping) and melody put together. You could simply strum or finger pick the chords and sing the melody or play an arrangement that puts the two together like a strummed melody or a jazz chord solo.

Next, work up a simple improvisation. It's usually good to start with minor and major pentatonic separately (if major pentatonic is appropriate), then work at combining them. It's common that your first tunes are blues-based. Use the I IV V major key blues guidelines in the I IV V Major Key Blues section below.

Step One: Comping and Rhythm

You can develop a comping part by memorizing comping rhythms and choosing one that seem appropriate. A good variety of comping rhythms is shown in the [Rhythmic Words And Comping Chapter](#), as well as other important aspects of rhythm.

Don't overlook the importance of playing with others and using rhythms the listener and other musicians expect. Study [Comping Strategies](#). You may also benefit from the [Keeping Time](#) chapter.

Memorize Primary [Rhythmic Words](#). Memorizing primary four-pulse and three pulse rhythmic words is very important for comping, melody and soloing. Each rhythmic word must be in your auditory memory and you must be able to play it as fast as your hands can move. See the Hearing Rhythmic Words section of [Rhythmic Words And Comping](#).

Step Two: Conceive the Melody

Read the melody and/or listen to it and sing it. If your source is a recording, listen to the recording and sing or play along with the melody.

If you read music and can get a copy of the sheet music that's great. Read it and listen to the recording. They may not match. Usually the recorded version is a better guide, so trust it. If you want to work on your reading, see the chapter [Speed Reading Pitch](#).

vocal songs

Get a copy of the lyrics and chords online and play the chords along with the recording. Sing with along with the recording separately, then while playing the chords. It's great to put the chords and melody together in your mind.

instrumental songs

Figure out the song by ear, if you can. Determine the key, according to which chord would seem to end the song in a traditional sense. In American pop music, including jazz, the bass part usually will give you the roots of the chords (the note each chord is named after is its root). If you can get tab or sheet music, that's a great method also. The more ways you learn a song, the better. Multiple input methods give you a better conception of the song.

Step Three: Putting the Melody and Chords Together

Whether you are playing the chords and singing or just playing instrumentally, find a way to represent the chords and melody at the same time. Sing the melody while strumming. Play a strummed melody, like *Here Comes The Sun*, where you incorporate the melody into your strumming. Work out an arrangement like a jazz chord solo where you play the melody and chords together. If the melody has breaks between the phrases, play the melody and strum chords in the breaks between phrases.

BUILD TONAL LAYERS BASED ON CORE MELODY

With core melody, you conceive and hear a simple basis of the melody comprised of one or two notes per bar. Simultaneously, you hear a melodic framework layer: an elaboration of the core melody using about one note per beat. Once you have the melodic framework in mind, you can start to elaborate it free form. You could memorize the melodic framework and elaborate it improvisationally in composing or performing.

Thirdly, your elaboration of the melodic framework can add notes to make two, three or four notes per beat, syncopation and theme and variation.

Fourth, pull out all the stops and go to full elaboration with ornamentation.

The concept of core melody and tonal layers in this course is similar to Heinrich Shenker's *Shenkerian Analysis*, where he analyzes pieces of music according to their most important notes being in the foreground (most apparent), next most important in the middle ground and least important in the background.

Prepare to Build the Layers

learn the chord progression

Learn the chord progression in numbers, as well as by letter names. Memorize it with a compelling rhythm you can imagine while improvising. Record it and play it back to study improving on it.⁶

learn to finger the chord progression in each area

Use the Triad, Pentatonic And Major Scale diagrams to construct chord fingerings for each chord in the progression. The chord tones are grey-backed numbers in bold.

improvise with a key pentatonic scale

First improvise with only the key pentatonic scale on the entire progression. Emphasize tones of the key scale that harmonize with the chords.

speak the chord roots, *while* you improvise

The root of each chord is the letter after which it is named. While you improvise, speak the letter for each chord root where the chord begins in time.

play an occasional arpeggio

Triad arpeggios are shown in the pentatonic diagrams on the top row of fingerings of major scale line structures on the following pages with the notes that are both bold and gray-backed. Ninth and seventh arpeggios are shown at the bottom of each of the following pages of major scale line structures.

Incorporate an occasional arpeggio into your improv, usually moving to the first arpeggio tone by scale step rather than by skip. While you ascend or descend the arpeggio it will usually cause skips, which is fine. Continue speaking the root numbers.

improvise with some pentatonic scales named after each chord

Primarily continue using the key pentatonic scale. Listeners like to ponder your melody as you play it, “buffering” phrases in their mind. In a sense, the listener composes your improv along with you, in your “collective” imagination. This is generally easier for the listener with *key scales*, those named after the key. Each section is usually in a single key and you should usually take care to make the use of scales in other keys occasional.

Learn the scale fingerings. In the rows of Triad, Pentatonic And Major Scale diagrams, each pentatonic scale is shown in grey-backed notes. Make some exception to the key pentatonic scale, also using scales on the second or fifth of the key. V scales can usually be played over IIm and over V. II minor scales can usually be played over IIm, IV and V.

Continue to speak the numbers of the chord roots while improvising. Sing what you play.

continue speaking the root numbers and play an occasional double stop

Arpeggios are shown in the pentatonic diagrams above with the notes that are both bold and gray-backed. Incorporate an occasional arpeggio into your improv. Continue speaking the root numbers.

The diagrams below show double stop structures for each chord. See Double Stops and Modal Double Stops By Triad Arc. While continuing to speak the chord root numbers while improvising, occasionally play a double stop figure to represent the current chord. Learn to integrate the double stops into your improvisation by segueing from the last pentatonic scale tone to a nearby tone (close in range of pitch) in the double stop figure.

C	Dm	Em	F	G	Am	Bdim
G	Am	Bm	C	D	Em	F#dim
D	Em	F#m	G	A	Bm	C#dim
A	Bm	C#m	D	E	F#m	G#dim
F	Gm	Am	Bb	C	Dm	Edim

Tonal Layer One: Core Melody

Duality tones are notes common to the current key scale and the current chord. The core melody uses one or two duality tones per bar. See [Core Melody Built with Duality Tones](#). Represent the chord tones by emphasizing the duality tones. Play the chord progression and hum or sing a melody that is very simple, two notes to the bar. That make a core melody. Once you establish a core melody, you can freely change its rhythm and elaborate it with the other layers.

Core melody, as defined in this chapter and course uses these four tonal layers:

- ✦ A simple elaboration of the melodic framework that uses one or more notes per beat and may use six to eight tone scales or elaborate the melodic framework with chromatics. Rhythmically, some syncopation is added
- ✦ A full elaboration with ornate decoration like mordents, turns and chromaticizing.

Tonal Layer Two: The Melodic Framework

Layer two, the melodic framework, elaborates the core melody using about one note per beat with scales or arpeggios of three to five notes. Audition the scale or arpeggios by singing and playing them and try to imagine a simple melody using them to elaborate the core melody.

pentatonic scales

If you have a strong blues, swing or rock background, use pentatonic scales. The second layer could also be a four or five-tone chord.

In this course, chords are often used to name pentatonic scales. See the next section, [Chord-Style Names for Pentatonic Scales](#). It's often useful to build two versions of the first layer, one based on major pentatonic and one on minor pentatonic. See the chapters [Pentatonic Scales and Octave Shapes](#), [Intro To Improvisation](#) and [Pentatonic Fingering](#).

A minor pentatonic basis suggests blues. I call it minor seventh eleven (m7/11). The fifth is commonly flatted, making minor seven eleven, flat five (m7/11b5). Also, the third is commonly natural, making dominant seven eleven, also called "seven eleven (7/11). With the dominant seven eleven scale, (7/11) the flatted third (enharmonically equal to sharp two) is used before the natural three.

A major pentatonic basis suggests swing or country music. A common variation is the minor 6/9 pentatonic scale which has only one modification to the major pentatonic scale: a flatted third. So, major 6/9 pentatonic is 1-2-3-5-6 and minor 6/9 pentatonic is 1-2-b3-5-6.

using arpeggios of four or five-note chords instead of pentatonic scales

Layer two could be chord tones, rather than pentatonic scale tones. Arpeggios are chords played one note at a time. Most pentatonic scales can be played as a chord by sustaining all the notes at once. Conversely, by playing a chord one note at a time (as an arpeggio), it becomes similar to a scale. Sixth and seventh chords have four notes each. While ninth chords, 6/9 chords, 7/11 chords and others have five notes each. See the chapter [All Scale-Tone Chords](#).

Tonal Layer Three: Simple Elaboration of the Melodic Framework

seven tone scales or large arpeggios

Once layers one and two have established the basic chord sound with the core melody and the melodic framework and given listeners a familiar context with the universally known pentatonic scales, the third layer can add the last few notes to make seven tone scales.

Not all styles of music use more than pentatonic scales (tonal layer two). Rock, blues and folk often only use pentatonic scales and don't use layer three. It is common that the vocal melodies in pop music use seven tone scales, while the guitar solos use only pentatonic scales.

Seven tone scales and large arpeggios can be used just as "filler" without any significant melodic purpose. It's better to often use seven tone scales and large arpeggios purposefully with melodic design. Explore the chapter [Melodic Cells](#) for design elements.

theme and variation

Theme and variation can be used in the third layer to elaborate the melodic framework. In studying theme and variation, you should learn to build a solo (or melody) with a simple basis of two, three or four notes, then create variations of it. This is covered in the chapters [Introduction to Improv](#), [Sections Built with Phrases](#) and [Theme and Variation](#).

simple syncopation

The simple elaboration of the melodic framework can introduce simple syncopation like syncopated eighth notes.

Tonal Layer Four: Full Elaboration of the Core Melody

One of the most significant improvisers in modern jazz is Charlie Parker. Charlie Parker's improvisation clearly uses core melody and melodic framework. He commonly superimposed a secondary chord progression (often through cadences) upon the original chord progression. He decorated arpeggios with scales and chromatics and bebop ornamentation. He usually played in swing, with much syncopation and rhythmic theme and variation.

The fourth layer can use melodically superimposed cadences. All of the layers can be ambiguous, with different versions simultaneously among different band members and different versions upon each instance of a chord progression. See the chapters [Melodically Superimposed Cadences](#) and [Scale Ambiguity](#).

complex rhythm

The full elaboration of the melodic framework can introduce complex syncopation (syncopated sixteenths and septuplets), anti-metric grouping and rhythmic displacement. See [Spontaneous Rhythmic Phrases](#).

BUILDING LAYERED PHRASES

See the chapters [Build Core Melody with Duality Tones, Tonal Themes and Schemes](#) and [Voice Leading](#).

Core Melody, Cell Elaboration, Filler

Phrases are build with core melody, elaborated with [melodic cells](#) and connected with “filler”. Filler is simply ascending or descending a scale or arpeggio or playing “stock” licks that don’t have any particular significance melodically.

Using Four Tonal Layers

While building the phrase with core melody, cell elaboration and filler, you’ll use different depths of arpeggios and scales. See the section [Build Four Tonal Layers](#).

Four Harmonic Families

The scales that make up the core melody, cell elaboration, filler and tonal layers are primarily derived from [The Four Harmonic Families](#) shown in that section of this chapter.

Base Your Melody on Theme and Variation

Establish the basis of your melody with minimalist themes of two, three or four notes, elaborating with rhythmic and harmonic theme and variation, as discussed earlier in [Step Three: Improv Layers One, Two and Three](#). See [Theme And Variation](#). Themes typically occur every two or four bars.

Target Tones

thinking in chunks

In putting together fast, complex phrases, we don’t think of every note. We recall phrases, scales, arpeggios and rhythms in groups of notes. We abstractly modify them with rhythmic and harmonic variation, using chromatics and chord substitution.

masterful improvisers conceive a simple basis: target tones

For the guitarist, this simple basis can be a graphic pattern of target tones on the fretboard. The visualization of target tones will be much easier once you understand [The Four Harmonic Families](#).

Chord substitution provides a lot of variability in playing on most chords in jazz-related styles. See [Substitution](#). Using an approach with a simple basis, you can trigger memories of scales, arpeggios and phrases, and use them to abstractly build longer phrases.

For each chord type you improvise on, you need to visualize where its tones lie on the fretboard.

playing a melodic cell on each target tone

Play a melodic cell on a each tone in a series of targets based on a harmonic family. Melodic cells are usually within the range of a fifth or less.

Play through the target tones in thirds, but also in perfect fifths, perfect fourths (quartal harmony on a harmonic family chord type), octaves, stepwise and chromatic. Melody is much more interesting with a diversity in the patterning of target tones.

Diversity if cell types is also important. Usually, don't repeat the same cell type on each target tone. Alternate between at least two or more types.

emphasize target tones with comper accents

In the solist's role, you need to have enough awareness as you are soloing that you can anticipate the most important accents the comper will play and emphasize the accents with target tones. See [Comping Strategies](#). Core melodic tones are those common to well-thought (and felt) key scales and preferred current chord tones. I also call them duality tones.

obscuring the beat

In a recent study, I've worked on obscuring the beat and chord to make fast passages more abstract and interesting. This causes us to be more capable of starting phrases on any part of the beat or bar. Likewise, predicting the comper (or soloist, depending on your role) requires the same capability.

Combine Melodic Cell Types

Practice sequences of each melodic cell type, so you can easily incorporate it into your improv. Melodic cells are often built on triads or thirds. Triads or thirds are usually part of larger chord. Learn to play the melodic cell on each triad on third part of the larger chord.

See [Melodic Cells](#).

THE FOUR HARMONIC FAMILIES

Chords are commonly referred to by type. Major or I type, Dorian minor or II type, and so on. Most chords can be thought of as part of one of four families: (1) minor fifteenth, (2) dominant thirteenth, (3) the Phrygian family (Phrygian, Phrygian, Phrygian major super Phrygian) and (4) the Lydian family (Lydian dominant, super Locrian and Dorian sharp four).

By practicing melodic cells on the two minor fifteenth arpeggio you develop the ability to improvise on five of the seven major scale-tone chord types. The V13 arpeggio covers four major scale-tone types, duplicating two of those in the IIm15 (IIIm7 and IIm7), but with different moods. These make up the most common families, the IIm15 and V13.

The last two of four families, Phrygian major and Lydian dominant are harmonic minor and melodic minor dominants and can enrich your playing while making it more effortless, if they are overviewed effectively (which is our goal). They are essential to the authentic jazz sound.

major scale target tones

These are numbered in terms of the parent scale. A V13 chord would ascend from “5” (root of V, red) to “3” (13 of V, yellow). IIm15 would ascend from “2” (root of II, blue) to a maximum “2” (“15” of II, blue).

Be careful to ascend in thirds:

The Two Minor Fifteenth Family

“II_m15” is a hypothetical chord name that implies all the tones of a major scale in thirds from “2”, through two octaves to “2” (2-4-6-1-3-5-7-2). The II_m15 family includes II_m13, IV_{ma}13#11, VI_m11, I_{ma}9 and III_m7. They are all part of II_m15. See [All Scale-Tone Chords](#) (which does not include II_m15, since it is hypothetical) for more types. On the same root as Dorian II_m13, Aeolian VI_m11 uses the same notes only through the eleventh, but since its Aeolian mode has a flat six.

“two” is the highest acceptable tone in all five chord types in the II_m15

This is really significant. We should have learned this right along with our seven and ninth arpeggios and modes. For every one of these five chord types (II_m7, IV_{ma}7, VI_m7, I_{ma}7, III_m7) the highest key scale tone in thirds that the common listener accepts is scale tone two.

For the key of C, for example a II minor chord is acceptable to the common ear as a minor fifteenth, where the highest note is the second octave above. The thirteenth serves as both a thirteenth chord tone and a “low six” in relation to the “15th” two octaves above the root. A “low six” functions as a lower scale tone to the root in the sense of a lower pentatonic scale tone, the sixth of a major pentatonic, for example.

VI_m and I type synonyms

Arpeggios rooted on scale tones six and one are very synonymous and are freely interchanged. Focusing on the six type is minor and darker in mood. Focusing on the one type is major and brighter in mood.

Synonyms include: VI_m7 = I₆, VI_m9 = I_{ma}7/6 and VI minor pentatonic (VI_m7/11) = I major pentatonic (I_{ma}6'9). Practice the VI_m11 arpeggio, its elaboration VI Aeolian and its subsets VI_m7, I_{ma}7 and III_m7 arpeggios all over the fretboard.

The three type provides upper harmonies for the six and one types, but cannot be extended beyond its seventh chord (to a ninth, for example) without producing an unacceptable chord (like a m7b9) or changing its type, like using a III_m9, which makes it a VI type.

II_m and IV type synonyms

II_m13 and IV_{ma}13#11 have the same seven notes, the entire major scale. So, the chords built on scale tones two and four are freely interchanged. The two type is minor and moderately dark in mood, while the four type is major and produces a bright exotic mood (with the potential #4 or #11). The six type provides upper harmonies for the two and four types, and be extended to a VI_m11.

Synonyms include: II_m7 = IV₆, III_m9 = IV_{ma}7/6 and II minor pentatonic (II_m7/11) = IV major pentatonic (IV_{ma}6'9).

Practice the IIm13 arpeggio, its elaboration II Dorian and its subsets IIm7, IVma7 and VIm7 arpeggios all over the fretboard.

IIm15 fretboard illustrations

The highest note in each of these is the scale tone "2".

Beginning with IIm15 (IIm13 with "15", two octaves above the root), progressively remove the bottom note to get IVma13#11, VIm11, Ima9 and IIIIm7:

IIm15 (Gm15) = 24613572

IIm15 no root is IVma13#11 (Fma13#11) = 4613572

IVma13#11 no root is VIm11 (Dm11) = 613572

VIm11 no root is Ima9 (Cma9) = 13572

Ima9 no root is IIIIm7 (Em7) = 3572.

There are many synonyms, making substitute chords.

The synonyms are based on IIm13 and IVma13#11 (which have the same seven notes);

IVma13#11 no root and VIm11 (same notes); VIm11 no root and Ima9 (same notes);

Ima9 no root = IIIIm7.

The Five Thirteenth Family

V13 implies all the tones of a major scale in thirds from “5” through “3” (5-7-2-4-6-1-3). The V15 family includes IIIIm7, V13, VIIIm11b9b5, IIm7. They are all part of V15. See [All Scale-Tone Chords](#).

“three” is the highest acceptable tone for V and VII types

In this family, the highest acceptable tone for the V13 and VII 11b9b5 arpeggios is major scale tone “3”. IIIIm7 is included in the family because of its synonyms with V type chords (there are IIIIm and V type chords that have the same notes, named after III or V).

IIm and IV type synonyms

Synonyms of IIIIm and V types include: IIIIm7 = V6 and III minor pentatonic (IIIIm7/11) = V major pentatonic (Vma6'9). The V7 is a funky chord, a hybrid of a bright major triad (5-7-2 of its parent scale) and a very dark diminished triad (7-2-4 of its parent). The IIIIm7 chord is dark in mood, especially when the tones a half step above its root and fifth are used. The mode on scale tone III is Phrygian, which is middle-eastern and Spanish by nature.

Practice the V13 arpeggio, its elaboration V Mixolydian and its subsets IIIIm7, V7 and VIIIm7b5 arpeggios all over the fretboard.

the five thirteen relationship to harmonic minor
